Overview

Target Technology Details

Microsoft Windows Server 2022 Secure Technical Implementation Guide (STIG)

Version: 2 Release: 4 Benchmark Date: 02 Apr 2025

Intended Audience

This benchmark is intended for system and application administrators, security specialists, auditors, help desk, and platform deployment personnel who plan to develop, deploy, assess, or secure solutions that incorporate Microsoft Windows Server 2022 and are looking to comply with the STIG guidance.

Recommendation Definitions

The following defines the various components included in a CIS recommendation as applicable. If any of the components are not applicable it will be noted, or the component will not be included in the recommendation.

Title

Concise description for the recommendation's intended configuration.

Assessment Status

An assessment status is included for every recommendation. The assessment status indicates whether the given recommendation can be automated or requires manual steps to implement. Both statuses are equally important and are determined and supported as defined below:

Automated

Represents recommendations for which assessment of a technical control can be fully automated and validated to a pass/fail state. Recommendations will include the necessary information to implement automation.

Manual

Represents recommendations for which assessment of a technical control cannot be fully automated and requires all or some manual steps to validate that the configured state is set as expected. The expected state can vary depending on the environment.

Profile

A collection of recommendations (or rules) for securing a technology or a supporting platform. STIG Benchmark profiles are used to identify which Vulnerability Severity Category Code (CAT) each rule is associated with.

Description

The Rule Title from the STIG.

Rationale Statement

Detailed reasoning for the recommendation to provide the user a clear and concise understanding on the importance of the recommendation.

Audit Procedure

Systematic instructions for determining if the target system complies with the recommendation.

Remediation Procedure

Systematic instructions for applying recommendations to the target system to bring it into compliance according to the recommendation.

Additional Information

References from the STIG Rule if applicable.

Profile Definitions

The following configuration profiles are defined by this Benchmark:

- **DC SEVERITY: CAT I**

Items in this profile exhibit one or more of the following characteristics:

- are considered to be high severity
- are intended for environments or use cases where following STIG based security guidance is paramount.
- acts as defense in depth measure.
- may negatively inhibit the utility or performance of the technology.

This profile is intended for Microsoft Windows Server 2022.

- **DC SEVERITY: CAT II**

Items in this profile exhibit one or more of the following characteristics:

- are considered to be medium severity
- are intended for environments or use cases where following STIG based security guidance is paramount.
- acts as defense in depth measure.
- may negatively inhibit the utility or performance of the technology.

This profile is intended for Microsoft Windows Server 2022.

- **DC SEVERITY: CAT III**

Items in this profile exhibit one or more of the following characteristics:

- are considered to be low severity
- are intended for environments or use cases where following STIG based security guidance is paramount.
- acts as defense in depth measure.
- may negatively inhibit the utility or performance of the technology.

This profile is intended for Microsoft Windows Server 2022.

- **MS SEVERITY: CAT I**

Items in this profile exhibit one or more of the following characteristics:

- are considered to be high severity
- are intended for environments or use cases where following STIG based security guidance is paramount.
- acts as defense in depth measure.
- may negatively inhibit the utility or performance of the technology.

This profile is intended for Microsoft Windows Server 2019 Member Server (MS).

- **MS SEVERITY: CAT II**

Items in this profile exhibit one or more of the following characteristics:

- are considered to be medium severity
- are intended for environments or use cases where following STIG based security guidance is paramount.
- acts as defense in depth measure.
- may negatively inhibit the utility or performance of the technology.

This profile is intended for Microsoft Windows Server 2019 Member Server (MS).

- **MS SEVERITY: CAT III**

Items in this profile exhibit one or more of the following characteristics:

- are considered to be low severity
- are intended for environments or use cases where following STIG based security guidance is paramount.
- acts as defense in depth measure.
- may negatively inhibit the utility or performance of the technology.

This profile is intended for Microsoft Windows Server 2019 Member Server (MS).

1 STIG RULES

Microsoft Windows Server 2022

Secure Technical Implementation Guide (STIG)

Version: 2 Release: 4 Date: 02 Apr 2025

CLASSIFICATION unclassified

1.1 WN22-00-000010 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 users with Administrative privileges must have separate accounts for administrative duties and normal operational tasks.

GROUP ID: V-254238 RULE ID: SV-254238r991589

Rationale:

Using a privileged account to perform routine functions makes the computer vulnerable to malicious software inadvertently introduced during a session that has been granted full privileges.

Audit:

Verify each user with administrative privileges has been assigned a unique administrative account separate from their standard user account.

If users with administrative privileges do not have separate accounts for administrative functions and standard user functions, this is a finding.

Remediation:

Ensure each user with administrative privileges has a separate account for user duties and one for privileged duties.

Additional Information:

CCI-000366

Implement the security configuration settings.

- NIST SP 800-53 :: CM-6 b

1.2 WN22-00-000020 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 passwords for the built-in Administrator account must be changed at least every 60 days.

GROUP ID: V-254239 RULE ID: SV-254239r1081067
--

Rationale:

The longer a password is in use, the greater the opportunity for someone to gain unauthorized knowledge of the password. The built-in Administrator account is not generally used and its password may not be changed as frequently as necessary. Changing the password for the built-in Administrator account on a regular basis will limit its exposure.

Windows LAPS must be used to change the built-in Administrator account password.

Audit:

If there are no enabled local Administrator accounts, this is not applicable.

Review the password last set date for the enabled local Administrator account.

On the stand alone or domain-joined workstation:

Open "PowerShell".

Enter

```
"Get-LocalUser -Name * | Select-Object *"
```

If the "PasswordLastSet" date is greater than "60" days old for the local Administrator account for administering the computer/domain, this is a finding.

Verify LAPS is configured and operational.

Navigate to

```
Local Computer Policy >> Computer Configuration >> Administrative Templates  
>> System >> LAPS >> Password Settings
```

>> Set to enabled. Password Complexity, large letters + small letters + numbers + special, Password Length 14, Password Age 60. If not configured as shown, this is a finding.

Verify LAPS Operational logs >> Event Viewer >> Applications and Services Logs >> Microsoft >> Windows >> LAPS >> Operational. Verify LAPS policy process is completing. If it is not, this is a finding.

If the server is not a member of a domain this not applicable.

Remediation:

Change the enabled local Administrator account password at least every 60 days. Windows LAPS must be used to change the built-in Administrator account password. Domain-joined systems can configure this to occur more frequently. LAPS will change the password every 30 days by default.

More information is available at:

1.3 WN22-00-000030 (Manual)

Profile Applicability:

- DC SEVERITY: CAT I
- MS SEVERITY: CAT I

Description:

Windows Server 2022 administrative accounts must not be used with applications that access the internet, such as web browsers, or with potential internet sources, such as email.

GROUP ID: V-254240 RULE ID: SV-254240r991589

Rationale:

Using applications that access the internet or have potential internet sources using administrative privileges exposes a system to compromise. If a flaw in an application is exploited while running as a privileged user, the entire system could be compromised. Web browsers and email are common attack vectors for introducing malicious code and must not be run with an administrative account.

Since administrative accounts may generally change or work around technical restrictions for running a web browser or other applications, it is essential that policy require administrative accounts to not access the internet or use applications such as email.

The policy must define specific exceptions for local service administration. These exceptions may include HTTP(S)-based tools that are used for the administration of the local system, services, or attached devices.

Whitelisting can be used to enforce the policy to ensure compliance.

Satisfies: SRG-OS-000480-GPOS-00227, SRG-OS-000205-GPOS-00083

Audit:

Determine whether organization policy, at a minimum, prohibits administrative accounts from using applications that access the internet, such as web browsers, or with potential internet sources, such as email, except as necessary for local service administration.

If it does not, this is a finding.

The organization may use technical means such as whitelisting to prevent the use of browsers and mail applications to enforce this requirement.

Remediation:

Establish a policy, at minimum, to prohibit administrative accounts from using applications that access the internet, such as web browsers, or with potential internet sources, such as email. Ensure the policy is enforced.

The organization may use technical means such as whitelisting to prevent the use of browsers and mail applications to enforce this requirement.

1.4 WN22-00-000040 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 members of the Backup Operators group must have separate accounts for backup duties and normal operational tasks.

GROUP ID: V-254241 RULE ID: SV-254241r991589

Rationale:

Backup Operators are able to read and write to any file in the system, regardless of the rights assigned to it. Backup and restore rights permit users to circumvent the file access restrictions present on NTFS disk drives for backup and restore purposes. Members of the Backup Operators group must have separate logon accounts for performing backup duties.

Audit:

If no accounts are members of the Backup Operators group, this is NA.

Verify users with accounts in the Backup Operators group have a separate user account for backup functions and for performing normal user tasks.

If users with accounts in the Backup Operators group do not have separate accounts for backup functions and standard user functions, this is a finding.

Remediation:

Ensure each member of the Backup Operators group has separate accounts for backup functions and standard user functions.

Additional Information:

CCI-000366

Implement the security configuration settings.

1.5 WN22-00-000050 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 manually managed application account passwords must be at least 14 characters in length.

GROUP ID: V-254242 RULE ID: SV-254242r1051087
--

Rationale:

Application/service account passwords must be of sufficient length to prevent being easily cracked. Application/service accounts that are manually managed must have passwords at least 14 characters in length.

Audit:

Determine if manually managed application/service accounts exist. If none exist, this is NA.

Verify the organization has a policy to ensure passwords for manually managed application/service accounts are at least 14 characters in length.

If such a policy does not exist or has not been implemented, this is a finding.

Remediation:

Establish a policy that requires application/service account passwords that are manually managed to be at least 14 characters in length. Ensure the policy is enforced.

Additional Information:

CCI-004066

For password-based authentication, enforce organization-defined composition and complexity rules.

- NIST SP 800-53 Revision 5 :: IA-5 (1) (h)

CCI-000205

The information system enforces minimum password length.

- NIST SP 800-53 :: IA-5 (1) (a)
- NIST SP 800-53 Revision 4 :: IA-5 (1) (a)
- NIST SP 800-53A :: IA-5 (1).1 (i)

1.6 WN22-00-000060 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 manually managed application account passwords must be changed at least annually or when a system administrator with knowledge of the password leaves the organization.

GROUP ID: V-254243 RULE ID: SV-254243r991589

Rationale:

Setting application account passwords to expire may cause applications to stop functioning. However, not changing them on a regular basis exposes them to attack. If managed service accounts are used, this alleviates the need to manually change application account passwords.

Audit:

Determine if manually managed application/service accounts exist. If none exist, this is NA.

If passwords for manually managed application/service accounts are not changed at least annually or when an administrator with knowledge of the password leaves the organization, this is a finding.

Identify manually managed application/service accounts.

To determine the date a password was last changed:

Domain controllers:

Open "PowerShell".

Enter

```
"Get-AdUser -Identity [application account name] -Properties PasswordLastSet  
| FT Name, PasswordLastSet"
```

where [application account name] is the name of the manually managed application/service account.

If the "PasswordLastSet" date is more than one year old, this is a finding.

Member servers and standalone or nondomain-joined systems:

Open "Command Prompt".

Enter

```
'Net User [application account name] | Find /i "Password Last Set"
```

where [application account name] is the name of the manually managed application/service account.

If the "Password Last Set" date is more than one year old, this is a finding.

Remediation:

Change passwords for manually managed application/service accounts at least annually or when an administrator with knowledge of the password leaves the organization.

It is recommended that system-managed service accounts be used whenever possible.

Additional Information:

CCI-000366

Implement the security configuration settings.

- NIST SP 800-53 Revision 4 :: CM-6 b
- NIST SP 800-53 Revision 5 :: CM-6 b
- NIST SP 800-53A :: CM-6.1 (iv)

1.7 WN22-00-000070 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 shared user accounts must not be permitted.

GROUP ID: V-254244 RULE ID: SV-254244r958482

Rationale:

Shared accounts (accounts where two or more people log on with the same user identification) do not provide adequate identification and authentication. There is no way to provide for nonrepudiation or individual accountability for system access and resource usage.

Audit:

Determine whether any shared accounts exist. If no shared accounts exist, this is NA.

Shared accounts, such as required by an application, may be approved by the organization. This must be documented with the Information System Security Officer (ISSO). Documentation must include the reason for the account, who has access to the account, and how the risk of using the shared account is mitigated to include monitoring account activity.

If unapproved shared accounts exist, this is a finding.

Remediation:

Remove unapproved shared accounts from the system.

Document required shared accounts with the ISSO. Documentation must include the reason for the account, who has access to the account, and how the risk of using the shared account is mitigated to include monitoring account activity.

Additional Information:

CCI-000764

Uniquely identify and authenticate organizational users and associate that unique identification with processes acting on behalf of those users.

- NIST SP 800-53 Revision 4 :: IA-2
- NIST SP 800-53 Revision 5 :: IA-2
- NIST SP 800-53A :: IA-2.1

1.8 WN22-00-000080 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must employ a deny-all, permit-by-exception policy to allow the execution of authorized software programs.

GROUP ID: V-254245 RULE ID: SV-254245r958808

Rationale:

Using an allowlist provides a configuration management method to allow the execution of only authorized software. Using only authorized software decreases risk by limiting the number of potential vulnerabilities.

The organization must identify authorized software programs and only permit execution of authorized software. The process used to identify software programs that are authorized to execute on organizational information systems is commonly referred to as allowlisting.

Audit:

Verify the operating system employs a deny-all, permit-by-exception policy to allow the execution of authorized software programs.

If an application allowlisting program is not in use on the system, this is a finding.

Configuration of allowlisting applications will vary by the program.

AppLocker is an allowlisting application built in to Windows Server. A deny-by-default implementation is initiated by enabling any AppLocker rules within a category, only allowing what is specified by defined rules.

If AppLocker is used, perform the following to view the configuration of AppLocker:

Open "PowerShell".

If the AppLocker PowerShell module has not been imported previously, execute the following first:

```
Import-Module AppLocker
```

Execute the following command, substituting [c:\temp\file.xml] with a location and file name appropriate for the system:

```
Get-AppLockerPolicy -Effective -XML > c:\temp\file.xml
```

This will produce an xml file with the effective settings that can be viewed in a browser or opened in a program such as Excel for review.

Implementation guidance for AppLocker is available at the following link:

<https://docs.microsoft.com/en-us/windows/security/threat-protection/windows-defender-application-control/applocker/applocker-policies-deployment-guide>

Remediation:

Configure an application allowlisting program to employ a deny-all, permit-by-exception policy to allow the execution of authorized software programs.

Configuration of allowlisting applications will vary by the program. AppLocker is an allowlisting application built in to Windows Server.

If AppLocker is used, it is configured through group policy in

```
Computer Configuration >> Windows Settings >> Security Settings >>  
Application Control Policies >> AppLocker
```

Implementation guidance for AppLocker is available at the following link:

<https://docs.microsoft.com/en-us/windows/security/threat-protection/windows-defender-application-control/applocker/applocker-policies-deployment-guide>

Additional Information:

CCI-001774

Employ a deny-all, permit-by-exception policy to allow the execution of authorized software programs on the system.

- NIST SP 800-53 Revision 5 :: CM-7 (5) (b)

1.9 WN22-00-000090 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 domain-joined systems must have a Trusted Platform Module (TPM) enabled and ready for use.

GROUP ID: V-254246 RULE ID: SV-254246r991589

Rationale:

Credential Guard uses virtualization-based security to protect data that could be used in credential theft attacks if compromised. A number of system requirements must be met in order for Credential Guard to be configured and enabled properly. Without a TPM enabled and ready for use, Credential Guard keys are stored in a less secure method using software.

Audit:

For standalone or nondomain-joined systems, this is NA.

Verify the system has a TPM and it is ready for use.

Run "tpm.msc".

Review the sections in the center pane.

"Status" must indicate it has been configured with a message such as "The TPM is ready for use" or "The TPM is on and ownership has been taken".

TPM Manufacturer Information - Specific Version = 2.0 or 1.2

If a TPM is not found or is not ready for use, this is a finding.

Remediation:

Ensure domain-joined systems have a TPM that is configured for use. (Versions 2.0 or 1.2 support Credential Guard.)

The TPM must be enabled in the firmware.

Run "tpm.msc" for configuration options in Windows.

Additional Information:

CCI-000366

Implement the security configuration settings.

- NIST SP 800-53 :: CM-6 b
- NIST SP 800-53 Revision 4 :: CM-6 b
- NIST SP 800-53 Revision 5 :: CM-6 b
- NIST SP 800-53A :: CM-6.1 (iv)

1.10 WN22-00-000100 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must be maintained at a supported servicing level.

GROUP ID: V-254247 RULE ID: SV-254247r991589

Rationale:

Systems at unsupported servicing levels will not receive security updates for new vulnerabilities, which leave them subject to exploitation. Systems must be maintained at a servicing level supported by the vendor with new security updates.

Audit:

Open "Command Prompt".

Enter "winver.exe".

If the "About Windows" dialog box does not display "Microsoft Windows Server Version 21H1 (Build 20348.xxx)" or greater, this is a finding.

Preview versions must not be used in a production environment.

Remediation:

Update the system to a Version 21H2 (Build 20348.xxx) or greater.

Additional Information:

CCI-000366

Implement the security configuration settings.

- NIST SP 800-53 :: CM-6 b
- NIST SP 800-53 Revision 4 :: CM-6 b
- NIST SP 800-53 Revision 5 :: CM-6 b

1.11 WN22-00-000110 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must use an antivirus program.

```
GROUP ID: V-254248
RULE ID: SV-254248r991589
```

Rationale:

Malicious software can establish a base on individual desktops and servers. Employing an automated mechanism to detect this type of software will aid in elimination of the software from the operating system.

Audit:

Verify an antivirus solution is installed on the system. The antivirus solution may be bundled with an approved host-based security solution.

If there is no antivirus solution installed on the system, this is a finding.

Verify if Microsoft Defender antivirus is in use or enabled:

Open "PowerShell".

Enter

```
"get-service | where {$_.DisplayName -Like "*Defender*"} | Select
Status,DisplayName"
```

Verify if third-party antivirus is in use or enabled:

Open "PowerShell".

Enter

```
"get-service | where {$_.DisplayName -Like "*mcafee*"} | Select
Status,DisplayName"
```

Enter

```
"get-service | where {$_.DisplayName -Like "*symantec*"} | Select
Status,DisplayName"
```

Remediation:

If no antivirus software is in use, install Microsoft Defender or third-party antivirus.

Open "PowerShell".

Enter

```
"Install-WindowsFeature -Name Windows-Defender"
```

For third-party antivirus, install per antivirus instructions and disable Windows Defender.

Open "PowerShell".

Enter

```
"Uninstall-WindowsFeature -Name Windows-Defender"
```

Additional Information:

CCI-000366

Implement the security configuration settings.

1.12 WN22-00-000120 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must have a host-based intrusion detection or prevention system.

GROUP ID: V-254249 RULE ID: SV-254249r991589

Rationale:

A properly configured Host-based Intrusion Detection System (HIDS) or Host-based Intrusion Prevention System (HIPS) provides another level of defense against unauthorized access to critical servers. With proper configuration and logging enabled, such a system can stop and/or alert for many attempts to gain unauthorized access to resources.

Audit:

Determine whether there is a HIDS or HIPS on each server.

If the HIPS component of ESS is installed and active on the host and the alerts of blocked activity are being logged and monitored, this meets the requirement.

A HIDS device is not required on a system that has the role as the Network Intrusion Device (NID). However, this exception needs to be documented with the Information System Security Officer (ISSO).

If a HIDS is not installed on the system, this is a finding.

Remediation:

Install a HIDS or HIPS on each server.

Additional Information:

CCI-000366

Implement the security configuration settings.

1.13 WN22-00-000130 (Manual)

Profile Applicability:

- DC SEVERITY: CAT I
- MS SEVERITY: CAT I

Description:

Windows Server 2022 local volumes must use a format that supports NTFS attributes.

GROUP ID: V-254250 RULE ID: SV-254250r1081070
--

Rationale:

The ability to set access permissions and auditing is critical to maintaining the security and proper access controls of a system. To support this, volumes must be formatted using a file system that supports NTFS attributes.

Audit:

Open "Computer Management".

Select "Disk Management" under "Storage".

For each local volume, if the file system does not indicate "NTFS", this is a finding.

"ReFS" (resilient file system) is also acceptable and is not a finding.

CSV (Cluster Shared Volumes) is not a finding.

This does not apply to system partitions such the Recovery and EFI System Partition.

Remediation:

Format volumes to use NTFS, ReFS, or CSVFS.

Additional Information:

CCI-000213

Enforce approved authorizations for logical access to information and system resources in accordance with applicable access control policies.

- NIST SP 800-53A :: AC-3.1

1.14 WN22-00-000140 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 permissions for the system drive root directory (usually C:) must conform to minimum requirements.

GROUP ID: V-254251 RULE ID: SV-254251r958702

Rationale:

Changing the system's file and directory permissions allows the possibility of unauthorized and anonymous modification to the operating system and installed applications.

The default permissions are adequate when the Security Option "Network access: Let Everyone permissions apply to anonymous users" is set to "Disabled" (WN22-SO-000240).

Satisfies: SRG-OS-000312-GPOS-00122, SRG-OS-000312-GPOS-00123, SRG-OS-000312-GPOS-00124

Audit:

The default permissions are adequate when the Security Option "Network access: Let Everyone permissions apply to anonymous users" is set to "Disabled" (WN22-SO-000240).

Review the permissions for the system drive's root directory (usually C:). Nonprivileged groups such as Users or Authenticated Users must not have greater than "Read & execute" permissions except where noted as defaults. Individual accounts must not be used to assign permissions.

If permissions are not as restrictive as the default permissions listed below, this is a finding.

Viewing in File Explorer:

View the Properties of the system drive's root directory.

Select the "Security" tab, and the "Advanced" button.

Default permissions:

C:

Type - "Allow" for all

Inherited from - "None" for all

Principal - Access - Applies to

- SYSTEM - Full control - This folder, subfolders, and files
- Administrators - Full control - This folder, subfolders, and files
- Users - Read & execute - This folder, subfolders, and files
- Users - Create folders/append data - This folder and subfolders
- Users - Create files/write data - Subfolders only
- CREATOR OWNER - Full Control - Subfolders and files only

Alternately, use icacs:

Open "Command Prompt (Admin)".

Enter "icacs" followed by the directory:

"icacs c:"

The following results must be displayed:

c:

- NT AUTHORITY\SYSTEM:(OI)(CI)(F)
- BUILTIN\Administrators:(OI)(CI)(F)
- BUILTIN\Users:(OI)(CI)(RX)
- BUILTIN\Users:(CI)(AD)

- BUILTIN\Users:(CI)(IO)(WD)
- CREATOR OWNER:(OI)(CI)(IO)(F)

Successfully processed 1 files; Failed processing 0 files

Remediation:

Maintain the default permissions for the system drive's root directory and configure the Security Option "Network access: Let Everyone permissions apply to anonymous users" to "Disabled" (WN22-SO-000240).

Default Permissions

C:

Type - "Allow" for all

Inherited from - "None" for all

Principal - Access - Applies to

- SYSTEM - Full control - This folder, subfolders, and files
- Administrators - Full control - This folder, subfolders, and files
- Users - Read & execute - This folder, subfolders, and files
- Users - Create folders/append data - This folder and subfolders
- Users - Create files/write data - Subfolders only
- CREATOR OWNER - Full Control - Subfolders and files only

Additional Information:

CCI-002165

Enforce organization-defined discretionary access control policies over defined subjects and objects.

- NIST SP 800-53 Revision 4 :: AC-3 (4)
- NIST SP 800-53 Revision 5 :: AC-3 (4)

1.15 WN22-00-000150 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 permissions for program file directories must conform to minimum requirements.

GROUP ID: V-254252 RULE ID: SV-254252r958702

Rationale:

Changing the system's file and directory permissions allows the possibility of unauthorized and anonymous modification to the operating system and installed applications.

The default permissions are adequate when the Security Option "Network access: Let Everyone permissions apply to anonymous users" is set to "Disabled" (WN22-SO-000240).

Satisfies: SRG-OS-000312-GPOS-00122, SRG-OS-000312-GPOS-00123, SRG-OS-000312-GPOS-00124

Audit:

The default permissions are adequate when the Security Option "Network access: Let Everyone permissions apply to anonymous users" is set to "Disabled" (WN22-SO-000240).

Review the permissions for the program file directories (Program Files and Program Files [x86]). Nonprivileged groups such as Users or Authenticated Users must not have greater than "Read & execute" permissions. Individual accounts must not be used to assign permissions.

If permissions are not as restrictive as the default permissions listed below, this is a finding.

Viewing in File Explorer:

For each folder, view the Properties.

Select the "Security" tab, and the "Advanced" button.

Default permissions:

\Program Files and \Program Files (x86)

Type - "Allow" for all

Inherited from - "None" for all

Principal - Access - Applies to

- TrustedInstaller - Full control - This folder and subfolders
- SYSTEM - Modify - This folder only
- SYSTEM - Full control - Subfolders and files only
- Administrators - Modify - This folder only
- Administrators - Full control - Subfolders and files only
- Users - Read & execute - This folder, subfolders and files
- CREATOR OWNER - Full control - Subfolders and files only
- ALL APPLICATION PACKAGES - Read & execute - This folder, subfolders, and files
- ALL RESTRICTED APPLICATION PACKAGES - Read & execute - This folder, subfolders, and files

Alternately, use icacs:

Open a Command prompt (admin).

Enter "icacs" followed by the directory:

```
'icacs "c:\program files"
```

```
'icacs "c:\program files (x86)"
```

The following results must be displayed for each when entered:

```
c:\program files (c:\program files (x86))
```

- NT SERVICE\TrustedInstaller:(F)
- NT SERVICE\TrustedInstaller:(CI)(IO)(F)
- NT AUTHORITY\SYSTEM:(M)
- NT AUTHORITY\SYSTEM:(OI)(CI)(IO)(F)

1.17 WN22-00-000170 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 default permissions for the HKEY_LOCAL_MACHINE registry hive must be maintained.

GROUP ID: V-254254 RULE ID: SV-254254r958726

Rationale:

The registry is integral to the function, security, and stability of the Windows system. Changing the system's registry permissions allows the possibility of unauthorized and anonymous modification to the operating system.

Audit:

Review the registry permissions for the keys of the HKEY_LOCAL_MACHINE hive noted below.

If any nonprivileged groups such as Everyone, Users, or Authenticated Users have greater than Read permission, this is a finding.

If permissions are not as restrictive as the default permissions listed below, this is a finding:

Run "Regedit".

Right-click on the registry areas noted below.

Select "Permissions" and the "Advanced" button.

HKEY_LOCAL_MACHINE\SECURITY

- Type - "Allow" for all
- Inherited from - "None" for all
- Principal - Access - Applies to
- SYSTEM - Full Control - This key and subkeys
- Administrators - Special - This key and subkeys

HKEY_LOCAL_MACHINE\SOFTWARE

- Type - "Allow" for all
- Inherited from - "None" for all

- Principal - Access - Applies to
- Users - Read - This key and subkeys
- Administrators - Full Control - This key and subkeys
- SYSTEM - Full Control - This key and subkeys
- CREATOR OWNER - Full Control - This key and subkeys
- ALL APPLICATION PACKAGES - Read - This key and subkeys

HKEY_LOCAL_MACHINE\SYSTEM

- Type - "Allow" for all
- Inherited from - "None" for all
- Principal - Access - Applies to
- Users - Read - This key and subkeys
- Administrators - Full Control - This key and subkeys
- SYSTEM - Full Control - This key and subkeys
- CREATOR OWNER - Full Control - This key and Subkeys
- ALL APPLICATION PACKAGES - Read - This key and subkeys
- Server Operators - Read - This Key and subkeys (Domain controllers only)

Other examples under the noted keys may also be sampled. There may be some instances where nonprivileged groups have greater than Read permission.

Microsoft has given Read permission to the SOFTWARE and SYSTEM registry keys in Windows Server 2022 to the following SID. This is currently not a finding.

S-1-15-3-1024-1065365936-1281604716-3511738428-1654721687-432734479-3232135806-4053264122-3456934681

If the defaults have not been changed, these are not a finding.

Remediation:

Maintain the default permissions for the HKEY_LOCAL_MACHINE registry hive.

The default permissions of the higher-level keys are noted below.

HKEY_LOCAL_MACHINE\SECURITY

- Type - "Allow" for all
- Inherited from - "None" for all
- Principal - Access - Applies to
- SYSTEM - Full Control - This key and subkeys
- Administrators - Special - This key and subkeys

HKEY_LOCAL_MACHINE\SOFTWARE

- Type - "Allow" for all
- Inherited from - "None" for all
- Principal - Access - Applies to
- Users - Read - This key and subkeys
- Administrators - Full Control - This key and subkeys

- SYSTEM - Full Control - This key and subkeys
- CREATOR OWNER - Full Control - This key and subkeys
- ALL APPLICATION PACKAGES - Read - This key and subkeys

HKEY_LOCAL_MACHINE\SYSTEM

- Type - "Allow" for all
- Inherited from - "None" for all
- Principal - Access - Applies to
- Users - Read - This key and subkeys
- Administrators - Full Control - This key and subkeys
- SYSTEM - Full Control - This key and subkeys
- CREATOR OWNER - Full Control - This key and subkeys
- ALL APPLICATION PACKAGES - Read - This key and subkeys
- Server Operators - Read - This Key and subkeys (Domain controllers only)

Microsoft has also given Read permission to the SOFTWARE and SYSTEM registry keys in Windows Server 2022 to the following SID:

S-1-15-3-1024-1065365936-1281604716-3511738428-1654721687-432734479-3232135806-4053264122-3456934681

Additional Information:

CCI-002235

Prevent non-privileged users from executing privileged functions.

1.18 WN22-00-000180 (Manual)

Profile Applicability:

- DC SEVERITY: CAT III
- MS SEVERITY: CAT III

Description:

Windows Server 2022 nonadministrative accounts or groups must only have print permissions on printer shares.

GROUP ID: V-254255 RULE ID: SV-254255r958472

Rationale:

Windows shares are a means by which files, folders, printers, and other resources can be published for network users to access. Improper configuration can permit access to devices and data beyond a user's need.

Audit:

Open "Printers & scanners" in "Settings".

If there are no printers configured, this is NA. (Exclude Microsoft Print to PDF and Microsoft XPS Document Writer, which do not support sharing.)

For each printer:

Select the printer and "Manage".

Select "Printer Properties".

Select the "Sharing" tab.

If "Share this printer" is checked, select the "Security" tab.

If any standard user accounts or groups have permissions other than "Print", this is a finding.

The default is for the "Everyone" group to be given "Print" permission.

"All APPLICATION PACKAGES" and "CREATOR OWNER" are not standard user accounts.

Remediation:

Configure the permissions on shared printers to restrict standard users to only have Print permissions.

Additional Information:

CCI-000213

Enforce approved authorizations for logical access to information and system resources in accordance with applicable access control policies.

1.19 WN22-00-000190 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 outdated or unused accounts must be removed or disabled.

GROUP ID: V-254256 RULE ID: SV-254256r1051088
--

Rationale:

Outdated or unused accounts provide penetration points that may go undetected. Inactive accounts must be deleted if no longer necessary or, if still required, disabled until needed.

Audit:

Open "Windows PowerShell".

Domain Controllers:

Enter "Search-ADAccount -AccountInactive -UsersOnly -TimeSpan 35.00:00:00"

This will return accounts that have not been logged on to for 35 days, along with various attributes such as the Enabled status and LastLogonDate.

Member servers and standalone or nondomain-joined systems:

Copy or enter the lines below to the PowerShell window and enter. (Entering twice may be required. Do not include the quotes at the beginning and end of the query.)

```
"([ADSI]('WinNT://{0}' -f $env:COMPUTERNAME)).Children | Where {  
$.SchemaClassName -eq 'user' } | ForEach {  
$user = ([ADSI]$.Path)  
$lastLogin = $user.Properties.LastLogin.Value  
$enabled = ($user.Properties.UserFlags.Value -band 0x2) -ne 0x2  
if ($lastLogin -eq $null) {  
$lastLogin = 'Never'  
}  
Write-Host $user.Name $lastLogin $enabled  
}"
```

This will return a list of local accounts with the account name, last logon, and if the account is enabled (True/False).

For example: User1 10/31/2015 5:49:56 AM True

Review the list of accounts returned by the above queries to determine the finding validity for each account reported.

Exclude the following accounts:

- Built-in administrator account (Renamed, SID ending in 500)
- Built-in guest account (Renamed, Disabled, SID ending in 501)
- Application accounts

If any enabled accounts have not been logged on to within the past 35 days, this is a finding.

Inactive accounts that have been reviewed and deemed to be required must be documented with the Information System Security Officer (ISSO).

Remediation:

Regularly review accounts to determine if they are still active. Remove or disable accounts that have not been used in the last 35 days.

Additional Information:

CCI-003627

Disable accounts when the accounts have expired.

- NIST SP 800-53 Revision 5 :: AC-2 (3) (a)

CCI-000795

The organization manages information system identifiers by disabling the identifier after an organization-defined time period of inactivity.

1.20 WN22-00-000200 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 accounts must require passwords.

```
GROUP ID: V-254257  
RULE ID: SV-254257r958482
```

Rationale:

The lack of password protection enables anyone to gain access to the information system, which opens a backdoor opportunity for intruders to compromise the system as well as other resources. Accounts on a system must require passwords.

Audit:

Review the password required status for enabled user accounts.

Open "PowerShell".

Domain Controllers:

Enter

```
"Get-Aduser -Filter * -Properties Passwordnotrequired | FT Name,  
Passwordnotrequired, Enabled"
```

Exclude disabled accounts (e.g., DefaultAccount, Guest) and Trusted Domain Objects (TDOs).

If "Passwordnotrequired" is "True" or blank for any enabled user account, this is a finding.

Member servers and standalone or nondomain-joined systems:

Enter

```
'Get-CimInstance -Class Win32_Useraccount -Filter "PasswordRequired=False and  
LocalAccount=True" | FT Name, PasswordRequired, Disabled, LocalAccount'
```

Exclude disabled accounts (e.g., DefaultAccount, Guest).

If any enabled user accounts are returned with a "PasswordRequired" status of "False", this is a finding.

Remediation:

Configure all enabled accounts to require passwords.

The password required flag can be set by entering the following on a command line:

```
"Net user [username] /passwordreq:yes", substituting [username]
```

with the name of the user account.

Additional Information:

CCI-000764

Uniquely identify and authenticate organizational users and associate that unique identification with processes acting on behalf of those users.

- NIST SP 800-53 :: IA-2
- NIST SP 800-53 Revision 4 :: IA-2

1.21 WN22-00-000210 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 passwords must be configured to expire.

```
GROUP ID:V-254258
RULE ID: SV-254258r1051089
```

Rationale:

Passwords that do not expire or are reused increase the exposure of a password with greater probability of being discovered or cracked.

Audit:

Review the password never expires status for enabled user accounts.

Open "PowerShell".

Domain Controllers:

Enter

```
"Search-ADAccount -PasswordNeverExpires -UsersOnly | FT Name,
PasswordNeverExpires, Enabled"
```

Exclude application accounts, disabled accounts (e.g., DefaultAccount, Guest) and the krbtgt account.

If any enabled user accounts are returned with a "PasswordNeverExpires" status of "True", this is a finding.

Member servers and standalone or nondomain-joined systems:

Enter

```
'Get-CimInstance -Class Win32_Useraccount -Filter "PasswordExpires=False and
LocalAccount=True" | FT Name, PasswordExpires, Disabled, LocalAccount'
```

Exclude application accounts and disabled accounts (e.g., DefaultAccount, Guest).

If any enabled user accounts are returned with a "PasswordExpires" status of "False", this is a finding.

Remediation:

Configure all enabled user account passwords to expire.

Uncheck "Password never expires" for all enabled user accounts in Active Directory Users and Computers for domain accounts and Users in Computer Management for member servers and standalone or nondomain-joined systems. Document any exceptions with the information system security officer (ISSO).

Additional Information:

CCI-004066

For password-based authentication, enforce organization-defined composition and complexity rules.

- NIST SP 800-53 Revision 5 :: IA-5 (1) (h)

1.22 WN22-00-000220 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 system files must be monitored for unauthorized changes.

GROUP ID: V-254259 RULE ID: SV-254259r958794

Rationale:

Monitoring system files for changes against a baseline on a regular basis may help detect the possible introduction of malicious code on a system.

Audit:

Determine whether the system is monitored for unauthorized changes to system files (e.g., *.exe, *.bat, *.com, *.cmd, and *.dll) against a baseline on a weekly basis.

If system files are not monitored for unauthorized changes, this is a finding.

An approved and properly configured solution will contain both a list of baselines that includes all system file locations and a file comparison task that is scheduled to run at least weekly.

Remediation:

Monitor the system for unauthorized changes to system files (e.g., *.exe, *.bat, *.com, *.cmd, and *.dll) against a baseline on a weekly basis. This can be done with the use of various monitoring tools.

Additional Information:

CCI-001744

Implement organization-defined security responses automatically if baseline configurations are changed in an unauthorized manner.

1.23 WN22-00-000230 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 nonsystem-created file shares must limit access to groups that require it.

GROUP ID: V-254260 RULE ID: SV-254260r958524

Rationale:

Shares on a system provide network access. To prevent exposing sensitive information, where shares are necessary, permissions must be reconfigured to give the minimum access to accounts that require it.

Audit:

If only system-created shares such as "ADMIN\$", "C\$", and "IPC\$" exist on the system, this is NA. (System-created shares will display a message that it has been shared for administrative purposes when "Properties" is selected.)

Run "Computer Management".

Navigate to System Tools >> Shared Folders >> Shares.

Right-click any nonsystem-created shares.

Select "Properties".

Select the "Share Permissions" tab.

If the file shares have not been configured to restrict permissions to the specific groups or accounts that require access, this is a finding.

Select the "Security" tab.

If the permissions have not been configured to restrict permissions to the specific groups or accounts that require access, this is a finding.

Remediation:

If a nonsystem-created share is required on a system, configure the share and NTFS permissions to limit access to the specific groups or accounts that require it.

Remove any unnecessary nonsystem-created shares.

Additional Information:

CCI-001090

Prevent unauthorized and unintended information transfer via shared system resources.

1.24 WN22-00-000240 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must have software certificate installation files removed.

GROUP ID: V-254261 RULE ID: SV-254261r991589

Rationale:

Use of software certificates and their accompanying installation files for end users to access resources is less secure than the use of hardware-based certificates.

Audit:

Search all drives for *.p12 and *.pfx files.

If any files with these extensions exist, this is a finding.

This does not apply to server-based applications that have a requirement for .p12 certificate files or Adobe PreFlight certificate files. Some applications create files with extensions of .p12 that are not certificate installation files. Removal of noncertificate installation files from systems is not required. These must be documented with the Information System Security Officer (ISSO).

Remediation:

Remove any certificate installation files (*.p12 and *.pfx) found on a system.

Note: This does not apply to server-based applications that have a requirement for .p12 certificate files or Adobe PreFlight certificate files.

Additional Information:

CCI-000366

Implement the security configuration settings.

1.25 WN22-00-000250 (Manual)

Profile Applicability:

- DC SEVERITY: CAT I
- MS SEVERITY: CAT I

Description:

Windows Server 2022 systems requiring data at rest protections must employ cryptographic mechanisms to prevent unauthorized disclosure and modification of the information at rest.

GROUP ID: V-254262 RULE ID: SV-254262r958552

Rationale:

This requirement addresses protection of user-generated data as well as operating system-specific configuration data. Organizations may choose to employ different mechanisms to achieve confidentiality and integrity protections, as appropriate, in accordance with the security category and/or classification of the information.

Selection of a cryptographic mechanism is based on the need to protect the integrity of organizational information. The strength of the mechanism is commensurate with the security category and/or classification of the information. Organizations have the flexibility to either encrypt all information on storage devices (i.e., full disk encryption) or encrypt specific data structures (e.g., files, records, or fields).

Satisfies: SRG-OS-000185-GPOS-00079, SRG-OS-000404-GPOS-00183, SRG-OS-000405-GPOS-00184

Audit:

Verify systems that require additional protections due to factors such as inadequate physical protection or sensitivity of the data employ encryption to protect the confidentiality and integrity of all information at rest.

If they do not, this is a finding.

Remediation:

Configure systems that require additional protections due to factors such as inadequate physical protection or sensitivity of the data to employ encryption to protect the confidentiality and integrity of all information at rest.

Additional Information:

CCI-001199

Protects the confidentiality and/or integrity of organization-defined information at rest.

1.26 WN22-00-000260 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must implement protection methods such as TLS, encrypted VPNs, or IPsec if the data owner has a strict requirement for ensuring data integrity and confidentiality is maintained at every step of the data transfer and handling process.

GROUP ID: V-254263 RULE ID: SV-254263r958912

Rationale:

Information can be either unintentionally or maliciously disclosed or modified during preparation for transmission, for example, during aggregation, at protocol transformation points, and during packing/unpacking. These unauthorized disclosures or modifications compromise the confidentiality or integrity of the information.

Ensuring the confidentiality of transmitted information requires the operating system to take measures in preparing information for transmission. This can be accomplished via access control and encryption.

Use of this requirement will be limited to situations where the data owner has a strict requirement for ensuring data integrity and confidentiality is maintained at every step of the data transfer and handling process. When transmitting data, operating systems need to support transmission protection mechanisms such as TLS, encrypted VPNs, or IPsec.

Satisfies: SRG-OS-000425-GPOS-00189, SRG-OS-000426-GPOS-00190

Audit:

If the data owner has a strict requirement for ensuring data integrity and confidentiality is maintained at every step of the data transfer and handling process, verify protection methods such as TLS, encrypted VPNs, or IPsec have been implemented.

If protection methods have not been implemented, this is a finding.

Remediation:

Configure protection methods such as TLS, encrypted VPNs, or IPsec when the data owner has a strict requirement for ensuring data integrity and confidentiality is maintained at every step of the data transfer and handling process.

Additional Information:

CCI-002420

Maintain the confidentiality and/or integrity of information during preparation for transmission.

1.27 WN22-00-000270 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must have the roles and features required by the system documented.

GROUP ID: V-254264 RULE ID: SV-254264r958478

Rationale:

Unnecessary roles and features increase the attack surface of a system. Limiting roles and features of a system to only those necessary reduces this potential. The standard installation option (previously called Server Core) further reduces this when selected at installation.

Audit:

Required roles and features will vary based on the function of the individual system.

Roles and features specifically required to be disabled per the STIG are identified in separate requirements.

If the organization has not documented the roles and features required for the system(s), this is a finding.

The PowerShell command "Get-WindowsFeature" will list all roles and features with an "Install State".

Remediation:

Document the roles and features required for the system to operate. Uninstall any that are not required.

Additional Information:

CCI-000381

Configure the system to provide only organization-defined mission essential capabilities.

- NIST SP 800-53 :: CM-7
- NIST SP 800-53 Revision 4 :: CM-7 a

1.28 WN22-00-000280 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must have a host-based firewall installed and enabled.

GROUP ID: V-254265 RULE ID: SV-254265r991589

Rationale:

A firewall provides a line of defense against attack, allowing or blocking inbound and outbound connections based on a set of rules.

Satisfies: SRG-OS-000480-GPOS-00227, SRG-OS-000480-GPOS-00232

Audit:

Determine if a host-based firewall is installed and enabled on the system.

If a host-based firewall is not installed and enabled on the system, this is a finding.

The configuration requirements will be determined by the applicable firewall STIG.

Remediation:

Install and enable a host-based firewall on the system.

Additional Information:

CCI-000366

Implement the security configuration settings.

- NIST SP 800-53 :: CM-6 b

- NIST SP 800-53A :: CM-6.1 (iv)

CCI-002080

The organization employs either an allow-all, deny-by-exception or a deny-all, permit-by-exception policy for allowing organization-defined information systems to connect to external information systems.

- NIST SP 800-53 Revision 4 :: CA-3 (5)

1.29 WN22-00-000290 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must employ automated mechanisms to determine the state of system components with regard to flaw remediation using the following frequency: continuously, where Endpoint Security Solution (ESS) is used; 30 days, for any additional internal network scans not covered by ESS; and annually, for external scans by Computer Network Defense Service Provider (CNDSP).

GROUP ID: V-254266 RULE ID: SV-254266r1000154
--

Rationale:

Without the use of automated mechanisms to scan for security flaws on a continuous and/or periodic basis, the operating system or other system components may remain vulnerable to the exploits presented by undetected software flaws. The operating system may have an integrated solution incorporating continuous scanning using ESS and periodic scanning using other tools.

Audit:

Verify DOD-approved ESS software is installed and properly operating. Ask the site information system security manager (ISSM) for documentation of the ESS software installation and configuration.

If the ISSM is not able to provide a documented configuration for an installed ESS or if the ESS software is not properly maintained or used, this is a finding.

Note: Example of documentation can be a copy of the site's configuration control board (CCB)-approved software baseline with version of software noted or a memo from the ISSM stating current ESS software and version.

Remediation:

Install a DOD-approved ESS software and ensure it is operating continuously.

Additional Information:

CCI-000366

Implement the security configuration settings.

- NIST SP 800-53 Revision 4 :: CM-6 b
- NIST SP 800-53 Revision 5 :: CM-6 b
- NIST SP 800-53A :: CM-6.1 (iv)

1.30 WN22-00-000300 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must automatically remove or disable temporary user accounts after 72 hours.

GROUP ID: V-254267 RULE ID: SV-254267r958364

Rationale:

If temporary user accounts remain active when no longer needed or for an excessive period, these accounts may be used to gain unauthorized access. To mitigate this risk, automated termination of all temporary accounts must be set upon account creation.

Temporary accounts are established as part of normal account activation procedures when there is a need for short-term accounts without the demand for immediacy in account activation.

If temporary accounts are used, the operating system must be configured to automatically terminate these types of accounts after a DoD-defined time period of 72 hours.

To address access requirements, many operating systems may be integrated with enterprise-level authentication/access mechanisms that meet or exceed access control policy requirements.

Audit:

Review temporary user accounts for expiration dates.

Determine if temporary user accounts are used and identify any that exist. If none exist, this is NA.

Domain Controllers:

Open "PowerShell".

Enter

```
"Search-ADAccount -AccountExpiring | FT Name, AccountExpirationDate"
```

If "AccountExpirationDate" has not been defined within 72 hours for any temporary user account, this is a finding.

Member servers and standalone or nondomain-joined systems:

Open "Command Prompt".

Run

```
"Net user [username]"
```

```
`` where [username] is the name of the temporary user account.
```

```
If "Account expires" has not been defined within 72 hours for any temporary user account, this is a finding.
```

Remediation:

Configure temporary user accounts to automatically expire within 72 hours.

Domain accounts can be configured with an account expiration date, under "Account" properties.

Local accounts can be configured to expire with the command "Net user [username] /expires:[mm/dd/yyyy]", where [username] is the name of the temporary user account.

Delete any temporary user accounts that are no longer necessary.

Additional Information:

CCI-000016

Automatically remove or disable temporary and emergency accounts after an organization-defined time-period for each type of account.

- NIST SP 800-53 :: AC-2 (2)
- NIST SP 800-53 Revision 4 :: AC-2 (2)
- NIST SP 800-53 Revision 5 :: AC-2 (2)

1.31 WN22-00-000310 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must automatically remove or disable emergency accounts after the crisis is resolved or within 72 hours.

GROUP ID: V-254268 RULE ID: SV-254268r958508

Rationale:

Emergency administrator accounts are privileged accounts established in response to crisis situations where the need for rapid account activation is required. Therefore, emergency account activation may bypass normal account authorization processes. If these accounts are automatically disabled, system maintenance during emergencies may not be possible, thus adversely affecting system availability.

Emergency administrator accounts are different from infrequently used accounts (i.e., local logon accounts used by system administrators when network or normal logon/access is not available). Infrequently used accounts are not subject to automatic termination dates. Emergency accounts are accounts created in response to crisis situations, usually for use by maintenance personnel. The automatic expiration or disabling time period may be extended as needed until the crisis is resolved; however, it must not be extended indefinitely. A permanent account must be established for privileged users who need long-term maintenance accounts.

To address access requirements, many operating systems can be integrated with enterprise-level authentication/access mechanisms that meet or exceed access control policy requirements.

Audit:

Determine if emergency administrator accounts are used and identify any that exist. If none exist, this is NA.

If emergency administrator accounts cannot be configured with an expiration date due to an ongoing crisis, the accounts must be disabled or removed when the crisis is resolved.

If emergency administrator accounts have not been configured with an expiration date or have not been disabled or removed following the resolution of a crisis, this is a finding.

Domain Controllers:

Open "PowerShell".

Enter

```
"Search-ADAccount -AccountExpiring | FT Name, AccountExpirationDate"
```

If "AccountExpirationDate" has been defined and is not within 72 hours for an emergency administrator account, this is a finding.

Member servers and standalone or nondomain-joined systems:

Open "Command Prompt".

Run

```
"Net user [username]"
```

where [username] is the name of the emergency account.

If "Account expires" has been defined and is not within 72 hours for an emergency administrator account, this is a finding.

Remediation:

Remove emergency administrator accounts after a crisis has been resolved or configure the accounts to automatically expire within 72 hours.

Domain accounts can be configured with an account expiration date, under "Account" properties.

Local accounts can be configured to expire with the command "Net user [username] /expires:[mm/dd/yyyy]", where [username] is the name of the temporary user account.

Additional Information:

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must not the Server Message Block (SMB) v1 protocol installed.

```
GROUP ID: V-254275  
RULE ID: SV-254275r958478
```

Rationale:

SMBv1 is a legacy protocol that uses the MD5 algorithm as part of SMB. MD5 is known to be vulnerable to a number of attacks such as collision and preimage attacks and is not FIPS compliant.

Audit:

Different methods are available to disable SMBv1 on Windows Server 2022. This is the preferred method, however if WN22-00-000390 and WN22-00-000400 are configured, this is NA.

Open "Windows PowerShell" with elevated privileges (run as administrator).

Enter

```
"Get-WindowsFeature -Name FS-SMB1"
```

If "Installed State" is "Installed", this is a finding.

An Installed State of "Available" or "Removed" is not a finding.

Remediation:

Uninstall the SMBv1 protocol.

Open "Windows PowerShell" with elevated privileges (run as administrator).

Enter

```
"Uninstall-WindowsFeature -Name FS-SMB1 -Restart"
```

(Omit the Restart parameter if an immediate restart of the system cannot be done.)

Alternately:

Start "Server Manager".

Select the server with the feature.

Scroll down to "ROLES AND FEATURES" in the right pane.

Select "Remove Roles and Features" from the drop-down "TASKS" list.

Select the appropriate server on the "Server Selection" page and click "Next".

Deselect "SMB 1.0/CIFS File Sharing Support" on the "Features" page.

Click "Next" and "Remove" as prompted.

Additional Information:

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 FTP servers must be configured to prevent access to the system drive.

GROUP ID: V-254280 RULE ID: SV-254280r991589

Rationale:

The FTP service allows remote users to access shared files and directories that could provide access to system resources and compromise the system, especially if the user can gain access to the root directory of the boot drive.

Audit:

If FTP is not installed on the system, this is NA.

Open "Internet Information Services (IIS) Manager".

Select "Sites" under the server name.

For any sites with a Binding that lists FTP, right-click the site and select "Explore".

If the site is not defined to a specific folder for shared FTP resources, this is a finding.

If the site includes any system areas such as root of the drive, Program Files, or Windows directories, this is a finding.

Remediation:

Configure the FTP sites to allow access only to specific FTP shared resources. Do not allow access to other areas of the system.

Additional Information:

CCI-000366

Implement the security configuration settings.

- NIST SP 800-53 :: CM-6 b
- NIST SP 800-53 Revision 4 :: CM-6 b
- NIST SP 800-53 Revision 5 :: CM-6 b

1.44 WN22-00-000440 (Manual)

Profile Applicability:

- DC SEVERITY: CAT III
- MS SEVERITY: CAT III

Description:

The Windows Server 2022 time service must synchronize with an appropriate DOD time source.

GROUP ID: V-254281 RULE ID: SV-254281r1051090
--

Rationale:

The Windows Time Service controls time synchronization settings. Time synchronization is essential for authentication and auditing purposes. If the Windows Time Service is used, it must synchronize with a secure, authorized time source. Domain-joined systems are automatically configured to synchronize with domain controllers. If an NTP server is configured, it must synchronize with a secure, authorized time source.

Audit:

Review the Windows time service configuration.

Open an elevated "Command Prompt" (run as administrator).

Enter

```
"W32tm /query /configuration"
```

Domain-joined systems (excluding the domain controller with the PDC emulator role):

If the value for "Type" under "NTP Client" is not "NT5DS", this is a finding.

Other systems:

If systems are configured with a "Type" of "NTP", including standalone or nondomain-joined systems and the domain controller with the PDC Emulator role, and do not have a DOD time server defined for "NTPServer", this is a finding.

To determine the domain controller with the PDC Emulator role:

Open "PowerShell".

Enter

```
"Get-ADDomain | FT PDCEmulator"
```

Remediation:

Configure the system to synchronize time with an appropriate DOD time source.

Domain-joined systems use NT5DS to synchronize time from other systems in the domain by default.

If the system needs to be configured to an NTP server, configure the system to point to an authorized time server by setting the policy value for

```
Computer Configuration >> Administrative Templates >> System >> Windows Time Service >> Time Providers
```

Change "Configure Windows NTP Client" to "Enabled", and configure the "NtpServer" field to point to an appropriate DOD time server.

The US Naval Observatory operates stratum 1 time servers, identified at <https://www.cnmc.usff.navy.mil/Our-Commands/United-States-Naval-Observatory/Precise-Time-Department/Network-Time-Protocol-NTP/>. Time synchronization will occur through a hierarchy of time servers down to the local level. Clients and lower-level servers will synchronize with an authorized time server in the hierarchy.

Additional Information:

1.45 WN22-00-000450 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must have orphaned security identifiers (SIDs) removed from user rights.

GROUP ID: V-254282 RULE ID: SV-254282r991589

Rationale:

Accounts or groups given rights on a system may show up as unresolved SIDs for various reasons including deletion of the accounts or groups. If the account or group objects are reanimated, there is a potential they may still have rights no longer intended. Valid domain accounts or groups may also show up as unresolved SIDs if a connection to the domain cannot be established.

Audit:

Review the effective User Rights setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>  
Security Settings >> Local Policies >> User Rights Assignment
```

Review each User Right listed for any unresolved SIDs to determine whether they are valid, such as due to being temporarily disconnected from the domain. (Unresolved SIDs have the format that begins with "*S-1-".)

If any unresolved SIDs exist and are not for currently valid accounts or groups, this is a finding.

For server core installations, run the following command:

```
Secedit /export /areas USER_RIGHTS /cfg c:\path\UserRights.txt
```

The results in the file identify user right assignments by SID instead of group name. Review the SIDs for unidentified ones. A list of typical SIDs \ Groups is below, search Microsoft for articles on well known SIDs for others.

If any unresolved SIDs exist and are not for currently valid accounts or groups, this is a finding.

SID - Group

- S-1-5-11 - Authenticated Users
- S-1-5-113 - Local account
- S-1-5-114 - Local account and member of Administrators group
- S-1-5-19 - Local Service
- S-1-5-20 - Network Service
- S-1-5-32-544 - Administrators
- S-1-5-32-546 - Guests
- S-1-5-6 - Service
- S-1-5-9 - Enterprise Domain Controllers
- S-1-5-domain-512 - Domain Admins
- S-1-5-root domain-519 - Enterprise Admins
- S-1-5-80-3139157870-2983391045-3678747466-658725712-1809340420 - NT Service\WdiServiceHost

Remediation:

Remove any unresolved SIDs found in User Rights assignments and determined to not be for currently valid accounts or groups by removing the accounts or groups from the appropriate group policy.

Additional Information:

CCI-000366

Implement the security configuration settings.

1.46 WN22-00-000460 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 systems must have Unified Extensible Firmware Interface (UEFI) firmware and be configured to run in UEFI mode, not Legacy BIOS.

GROUP ID: V-254283 RULE ID: SV-254283r991589

Rationale:

UEFI provides additional security features in comparison to legacy BIOS firmware, including Secure Boot. UEFI is required to support additional security features in Windows, including Virtualization Based Security and Credential Guard. Systems with UEFI that are operating in "Legacy BIOS" mode will not support these security features.

Audit:

Devices that have UEFI firmware must run in "UEFI" mode.

Verify the system firmware is configured to run in "UEFI" mode, not "Legacy BIOS".

Run "System Information".

Under "System Summary", if "BIOS Mode" does not display "UEFI", this is a finding.

Remediation:

Configure UEFI firmware to run in "UEFI" mode, not "Legacy BIOS" mode.

Additional Information:

CCI-000366

Implement the security configuration settings.

- NIST SP 800-53 :: CM-6 b
- NIST SP 800-53 Revision 4 :: CM-6 b

1.47 WN22-00-000470 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must have Secure Boot enabled.

GROUP ID: V-254284 RULE ID: SV-254284r991589

Rationale:

Secure Boot is a standard that ensures systems boot only to a trusted operating system. Secure Boot is required to support additional security features in Windows, including Virtualization Based Security and Credential Guard. If Secure Boot is turned off, these security features will not function.

Audit:

Devices that have UEFI firmware must have Secure Boot enabled.

Run "System Information".

Under "System Summary", if "Secure Boot State" does not display "On", this is a finding.

On server core installations, run the following PowerShell command:

Confirm-SecureBootUEFI

If a value of "True" is not returned, this is a finding.

Remediation:

Enable Secure Boot in the system firmware.

Additional Information:

CCI-000366

Implement the security configuration settings.

- NIST SP 800-53 :: CM-6 b

1.48 WN22-AC-000010 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 account lockout duration must be configured to 15 minutes or greater.

```
GROUP ID: V-254285
RULE ID: SV-254285r958736
```

Rationale:

The account lockout feature, when enabled, prevents brute-force password attacks on the system. This parameter specifies the period of time that an account will remain locked after the specified number of failed logon attempts.

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>
Security Settings >> Account Policies >> Account Lockout Policy
```

If the "Account lockout duration" is less than "15" minutes (excluding "0"), this is a finding.

For server core installations, run the following command:

```
Secedit /Export /Areas SecurityPolicy /CFG C:\Path\FileName.Txt
```

If "LockoutDuration" is less than "15" (excluding "0") in the file, this is a finding.

Configuring this to "0", requiring an administrator to unlock the account, is more restrictive and is not a finding.

Remediation:

Configure the policy value for

```
Computer Configuration >> Windows Settings >> Security Settings >> Account
Policies >> Account Lockout Policy >> Account lockout duration to "15"
minutes or greater
```

A value of "0" is also acceptable, requiring an administrator to unlock the account.

References:

1. CIS Recommendation: Account lockout duration
2. GRID: MS-00000008

Additional Information:

CCI-002238

Automatically lock the account or node for either an organization-defined time period, until the locked account or node is released by an administrator, or delays the next logon prompt according to the organization-defined delay algorithm when the maximum number of unsuccessful logon attempts is exceeded.

1.49 WN22-AC-000020 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must have the number of allowed bad logon attempts configured to three or less.

GROUP ID: V-254286
RULE ID: SV-254286r958388

Rationale:

The account lockout feature, when enabled, prevents brute-force password attacks on the system. The higher this value is, the less effective the account lockout feature will be in protecting the local system. The number of bad logon attempts must be reasonably small to minimize the possibility of a successful password attack while allowing for honest errors made during normal user logon.

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

Local Computer Policy >> Computer Configuration >> Windows Settings >> Security Settings >> Account Policies >> Account Lockout Policy

If the "Account lockout threshold" is "0" or more than "3" attempts, this is a finding.

For server core installations, run the following command:

```
Secedit /Export /Areas SecurityPolicy /CFG C:\Path\FileName.Txt
```

If "LockoutBadCount" equals "0" or is greater than "3" in the file, this is a finding.

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Account Policies >> Account Lockout Policy >> Account lockout threshold to "3" or fewer invalid logon attempts (excluding "0", which is unacceptable)

References:

1. CIS Recommendation: Account lockout threshold
2. GRID: MS-00000009

Additional Information:

CCI-000044

Enforce the organization-defined limit of consecutive invalid logon attempts by a user during the organization-defined time period.

- NIST SP 800-53 :: AC-7 a

1.50 WN22-AC-000030 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must have the period of time before the bad logon counter is reset configured to 15 minutes or greater.

GROUP ID: V-254287
RULE ID: SV-254287r958388

Rationale:

The account lockout feature, when enabled, prevents brute-force password attacks on the system. This parameter specifies the period of time that must pass after failed logon attempts before the counter is reset to "0". The smaller this value is, the less effective the account lockout feature will be in protecting the local system.

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

Local Computer Policy >> Computer Configuration >> Windows Settings >>
Security Settings >> Account Policies >> Account Lockout Policy

If the "Reset account lockout counter after" value is less than "15" minutes, this is a finding.

For server core installations, run the following command:

```
Secedit /Export /Areas SecurityPolicy /CFG C:\Path\FileName.Txt
```

If "ResetLockoutCount" is less than "15" in the file, this is a finding.

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Account
Policies >> Account Lockout Policy >> Reset account lockout counter after to
at least "15" minutes

References:

1. CIS Recommendation: Reset account lockout counter after
2. GRID: MS-00000011

Additional Information:

1.51 WN22-AC-000040 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 password history must be configured to 24 passwords remembered.

```
GROUP ID: V-254288  
RULE ID: SV-254288r1000156
```

Rationale:

A system is more vulnerable to unauthorized access when system users recycle the same password several times without being required to change to a unique password on a regularly scheduled basis. This enables users to effectively negate the purpose of mandating periodic password changes. The default value is "24" for Windows domain systems. DOD has decided this is the appropriate value for all Windows systems.

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>  
Security Settings >> Account Policies >> Password Policy
```

If the value for "Enforce password history" is less than "24" passwords remembered, this is a finding.

For server core installations, run the following command:

```
Secedit /Export /Areas SecurityPolicy /CFG C:\Path\FileName.Txt
```

If "PasswordHistorySize" is less than "24" in the file, this is a finding.

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Account Policies >> Password Policy >> Enforce password history to "24" passwords remembered

References:

1. CIS Recommendation: Enforce password history
2. GRID: MS-00000001

Additional Information:

CCI-004061

For password-based authentication, verify when users create or update passwords, that the passwords are not found on the list of commonly-used, expected, or compromised passwords in IA-5 (1) (a).

- NIST SP 800-53 Revision 5 :: IA-5 (1) (b)

1.52 WN22-AC-000050 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 maximum password age must be configured to 60 days or less.

```
GROUP ID: V-254289
RULE ID: SV-254289r1051091
```

Rationale:

The longer a password is in use, the greater the opportunity for someone to gain unauthorized knowledge of the passwords. Scheduled changing of passwords hinders the ability of unauthorized system users to crack passwords and gain access to a system.

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>
Security Settings >> Account Policies >> Password Policy
```

If the value for the "Maximum password age" is greater than "60" days, this is a finding.

If the value is set to "0" (never expires), this is a finding.

For server core installations, run the following command:

```
Secedit /Export /Areas SecurityPolicy /CFG C:\Path\FileName.Txt
```

If "MaximumPasswordAge" is greater than "60" or equal to "0" in the file, this is a finding.

Remediation:

Configure the policy value for

```
Computer Configuration >> Windows Settings >> Security Settings >> Account
Policies >> Password Policy >> Maximum password age to "60" days or less
(excluding "0", which is unacceptable)
```

References:

1. CIS Recommendation: Maximum password age
2. GRID: MS-00000002

Additional Information:

CCI-004066

For password-based authentication, enforce organization-defined composition and complexity rules.

- NIST SP 800-53 Revision 5 :: IA-5 (1) (h)

1.53 WN22-AC-000060 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 minimum password age must be configured to at least one day.

```
GROUP ID: V-254290
RULE ID: SV-254290r1051092
```

Rationale:

Permitting passwords to be changed in immediate succession within the same day allows users to cycle passwords through their history database. This enables users to effectively negate the purpose of mandating periodic password changes.

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>
Security Settings >> Account Policies >> Password Policy
```

If the value for the "Minimum password age" is set to "0" days ("Password can be changed immediately"), this is a finding.

For server core installations, run the following command:

```
Secedit /Export /Areas SecurityPolicy /CFG C:\Path\FileName.Txt
```

If "MinimumPasswordAge" equals "0" in the file, this is a finding.

Fix Text:

Remediation:

Configure the policy value for

```
Computer Configuration >> Windows Settings >> Security Settings >> Account
Policies >> Password Policy >> Minimum password age to at least "1" day
```

References:

1. CIS Recommendation: Minimum password age
2. GRID: MS-00000003

Additional Information:

1.54 WN22-AC-000070 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 minimum password length must be configured to 14 characters.

```
GROUP ID: V-254291
RULE ID: SV-254291r1051093
```

Rationale:

Information systems not protected with strong password schemes (including passwords of minimum length) provide the opportunity for anyone to crack the password, thus gaining access to the system and compromising the device, information, or the local network.

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>
Security Settings >> Account Policies >> Password Policy
```

If the value for the "Minimum password length," is less than "14" characters, this is a finding.

For server core installations, run the following command:

```
Secedit /Export /Areas SecurityPolicy /CFG C:\Path\FileName.Txt
```

If "MinimumPasswordLength" is less than "14" in the file, this is a finding.

Remediation:

Configure the policy value for

```
Computer Configuration >> Windows Settings >> Security Settings >> Account
Policies >> Password Policy >> "Minimum password length" to "14" characters
```

References:

1. CIS Recommendation: Minimum password length
2. GRID: MS-00000004

1.55 WN22-AC-000080 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must have the built-in Windows password complexity policy enabled.

```
GROUP ID: V-254292
RULE ID: SV-254292r1051094
```

Rationale:

The use of complex passwords increases their strength against attack. The built-in Windows password complexity policy requires passwords to contain at least three of the four types of characters (numbers, uppercase and lowercase letters, and special characters) and prevents the inclusion of user names or parts of user names.

Satisfies: SRG-OS-000069-GPOS-00037, SRG-OS-000070-GPOS-00038, SRG-OS-000071-GPOS-00039, SRG-OS-000266-GPOS-00101

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>
Security Settings >> Account Policies >> Password Policy
```

If the value for "Password must meet complexity requirements" is not set to "Enabled", this is a finding.

For server core installations, run the following command:

```
Secedit /Export /Areas SecurityPolicy /CFG C:\Path\FileName.Txt
```

If "PasswordComplexity" equals "0" in the file, this is a finding.

Note: If an external password filter is in use that enforces all four character types and requires this setting to be set to "Disabled", this would not be considered a finding. If this setting does not affect the use of an external password filter, it must be enabled for fallback purposes.

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Account Policies >> Password Policy >> Password must meet complexity requirements to "Enabled"

References:

1. CIS Recommendation: Password must meet complexity requirements
2. GRID: MS-00000005

1.56 WN22-AC-000090 (Automated)

Profile Applicability:

- DC SEVERITY: CAT I
- MS SEVERITY: CAT I

Description:

Windows Server 2022 reversible password encryption must be disabled.

```
GROUP ID: V-254293
RULE ID: SV-254293r1051095
```

Rationale:

Storing passwords using reversible encryption is essentially the same as storing clear-text versions of the passwords, which are easily compromised. For this reason, this policy must never be enabled.

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>
Security Settings >> Account Policies >> Password Policy
```

If the value for "Store passwords using reversible encryption" is not set to "Disabled", this is a finding.

For server core installations, run the following command:

```
Secedit /Export /Areas SecurityPolicy /CFG C:\Path\FileName.Txt
```

If "ClearTextPassword" equals "1" in the file, this is a finding.

Remediation:

Configure the policy value for

```
Computer Configuration >> Windows Settings >> Security Settings >> Account
Policies >> Password Policy >> Store passwords using reversible encryption to
"Disabled"
```

References:

1. CIS Recommendation: Store passwords using reversible encryption
2. GRID: MS-00000007

1.58 WN22-AU-000020 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must, at a minimum, offload audit records of interconnected systems in real time and offload standalone or nondomain-joined systems weekly.

GROUP ID: V-254295 RULE ID: SV-254295r959008

Rationale:

Protection of log data includes assuring the log data is not accidentally lost or deleted. Audit information stored in one location is vulnerable to accidental or incidental deletion or alteration.

Audit:

Verify the audit records, at a minimum, are offloaded for interconnected systems in real time and offloaded for standalone or nondomain-joined systems weekly.

If they are not, this is a finding.

Remediation:

Configure the system to, at a minimum, offload audit records of interconnected systems in real time and offload standalone or nondomain-joined systems weekly.

Additional Information:

CCI-001851

Transfer audit logs per organization-defined frequency to a different system, system component, or media than the system or system component conducting the logging.

1.59 WN22-AU-000030 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 permissions for the Application event log must prevent access by nonprivileged accounts.

GROUP ID: V-254296 RULE ID: SV-254296r958434

Rationale:

Maintaining an audit trail of system activity logs can help identify configuration errors, troubleshoot service disruptions, and analyze compromises that have occurred, as well as detect attacks. Audit logs are necessary to provide a trail of evidence in case the system or network is compromised. The Application event log may be susceptible to tampering if proper permissions are not applied.

Satisfies: SRG-OS-000057-GPOS-00027, SRG-OS-000058-GPOS-00028, SRG-OS-000059-GPOS-00029

Audit:

Navigate to the Application event log file.

The default location is the "%SystemRoot%\System32\winevt\Logs" folder. However, the logs may have been moved to another folder.

If the permissions for the "Application.evtx" file are not as restrictive as the default permissions listed below, this is a finding:

- Eventlog - Full Control
- SYSTEM - Full Control
- Administrators - Full Control

Remediation:

Configure the permissions on the Application event log file (Application.evtx) to prevent access by nonprivileged accounts. The default permissions listed below satisfy this requirement:

- Eventlog - Full Control
- SYSTEM - Full Control
- Administrators - Full Control

The default location is the "%SystemRoot%\System32\winevt\Logs" folder.

If the location of the logs has been changed, when adding Eventlog to the permissions, it must be entered as "NT Service\Eventlog".

Description:

Windows Server 2022 Event Viewer must be protected from unauthorized modification and deletion.

GROUP ID: V-254299 RULE ID: SV-254299r991558

Rationale:

Protecting audit information also includes identifying and protecting the tools used to view and manipulate log data. Therefore, protecting audit tools is necessary to prevent unauthorized operation on audit information.

Operating systems providing tools to interface with audit information will leverage user permissions and roles identifying the user accessing the tools and the corresponding rights the user enjoys to make access decisions regarding the modification or deletion of audit tools.

Satisfies: SRG-OS-000257-GPOS-00098, SRG-OS-000258-GPOS-00099

Audit:

This is not applicable for Windows Core Edition.

Navigate to "%SystemRoot%\System32".

View the permissions on "Eventvwr.exe".

If any groups or accounts other than TrustedInstaller have "Full control" or "Modify" permissions, this is a finding.

The default permissions below satisfy this requirement:

TrustedInstaller - Full Control

Administrators, SYSTEM, Users, ALL APPLICATION PACKAGES, ALL RESTRICTED APPLICATION PACKAGES - Read & Execute

Remediation:

Configure the permissions on the "Eventvwr.exe" file to prevent modification by any groups or accounts other than TrustedInstaller. The default permissions listed below satisfy this requirement:

TrustedInstaller - Full Control

Administrators, SYSTEM, Users, ALL APPLICATION PACKAGES, ALL RESTRICTED APPLICATION PACKAGES - Read & Execute

The default location is the "%SystemRoot%\System32" folder.

1.63 WN22-AU-000070 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must be configured to audit Account Logon - Credential Validation successes.

```
GROUP ID: V-254300  
RULE ID: SV-254300r991578
```

Rationale:

Maintaining an audit trail of system activity logs can help identify configuration errors, troubleshoot service disruptions, and analyze compromises that have occurred, as well as detect attacks. Audit logs are necessary to provide a trail of evidence in case the system or network is compromised. Collecting this data is essential for analyzing the security of information assets and detecting signs of suspicious and unexpected behavior.

Credential Validation records events related to validation tests on credentials for a user account logon.

Audit:

Security Option "Audit: Force audit policy subcategory settings (Windows Vista or later) to override audit policy category settings" must be set to "Enabled" (WN22-SO-000050) for the detailed auditing subcategories to be effective.

Use the "AuditPol" tool to review the current Audit Policy configuration:

Open "PowerShell" or a "Command Prompt" with elevated privileges ("Run as administrator").

Enter

```
"AuditPol /get /category:*
```

Compare the "AuditPol" settings with the following:

If the system does not audit the following, this is a finding.

Account Logon >> Credential Validation - Success

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Advanced Audit Policy Configuration >> System Audit Policies >> Account Logon >> Audit Credential Validation with "Success" selected

1.69 WN22-AU-000130 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must be configured to audit Detailed Tracking - Plug and Play Events successes.

```
GROUP ID: V-254306  
RULE ID: SV-254306r991583
```

Rationale:

Maintaining an audit trail of system activity logs can help identify configuration errors, troubleshoot service disruptions, and analyze compromises that have occurred, as well as detect attacks. Audit logs are necessary to provide a trail of evidence in case the system or network is compromised. Collecting this data is essential for analyzing the security of information assets and detecting signs of suspicious and unexpected behavior.

Plug and Play activity records events related to the successful connection of external devices.

Audit:

Security Option "Audit: Force audit policy subcategory settings (Windows Vista or later) to override audit policy category settings" must be set to "Enabled" (WN22-SO-000050) for the detailed auditing subcategories to be effective.

Use the "AuditPol" tool to review the current Audit Policy configuration:

Open "PowerShell" or a "Command Prompt" with elevated privileges ("Run as administrator").

Enter

```
"AuditPol /get /category:*
```

Compare the "AuditPol" settings with the following:

If the system does not audit the following, this is a finding.

Detailed Tracking >> Plug and Play Events - Success

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Advanced Audit Policy Configuration >> System Audit Policies >> Detailed Tracking >> Audit PNP Activity with "Success" selected

References:

1. CIS Recommendation: Audit PNP Activity
2. GRID: MS-00000205

Additional Information:

CCI-000172

Generate audit records for the event types defined in AU-2 c that include the audit record content defined in AU-3.

- NIST SP 800-53 :: AU-12 c

1.81 WN22-AU-000260 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must be configured to audit Policy Change - Audit Policy Change successes.

GROUP ID: V-254319 RULE ID: SV-254319r958732

Rationale:

Maintaining an audit trail of system activity logs can help identify configuration errors, troubleshoot service disruptions, and analyze compromises that have occurred, as well as detect attacks. Audit logs are necessary to provide a trail of evidence in case the system or network is compromised. Collecting this data is essential for analyzing the security of information assets and detecting signs of suspicious and unexpected behavior.

Audit Policy Change records events related to changes in audit policy.

Satisfies: SRG-OS-000327-GPOS-00127, SRG-OS-000458-GPOS-00203, SRG-OS-000463-GPOS-00207, SRG-OS-000468-GPOS-00212

Audit:

Security Option "Audit: Force audit policy subcategory settings (Windows Vista or later) to override audit policy category settings" must be set to "Enabled" (WN22-SO-000050) for the detailed auditing subcategories to be effective.

Use the "AuditPol" tool to review the current Audit Policy configuration:

Open "PowerShell" or a "Command Prompt" with elevated privileges ("Run as administrator").

Enter

"AuditPol /get /category:*

Compare the "AuditPol" settings with the following:

If the system does not audit the following, this is a finding.

Policy Change >> Audit Audit Policy Change - Success

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Advanced Audit Policy Configuration >> System Audit Policies >> Policy Change >> Audit Audit Policy Change with "Success" selected

Maintaining an audit trail of system activity logs can help identify configuration errors, troubleshoot service disruptions, and analyze compromises that have occurred, as well as detect attacks. Audit logs are necessary to provide a trail of evidence in case the system or network is compromised. Collecting this data is essential for analyzing the security of information assets and detecting signs of suspicious and unexpected behavior.

Security System Extension records events related to extension code being loaded by the security subsystem.

Satisfies: SRG-OS-000327-GPOS-00127, SRG-OS-000458-GPOS-00203, SRG-OS-000463-GPOS-00207, SRG-OS-000468-GPOS-00212

Audit:

Security Option "Audit: Force audit policy subcategory settings (Windows Vista or later) to override audit policy category settings" must be set to "Enabled" (WN22-SO-000050) for the detailed auditing subcategories to be effective.

Use the "AuditPol" tool to review the current Audit Policy configuration:

Open "PowerShell" or a "Command Prompt" with elevated privileges ("Run as administrator").

Enter

"AuditPol /get /category:*

Compare the "AuditPol" settings with the following:

If the system does not audit the following, this is a finding.

System >> Security System Extension - Success

Remediation:

Configure the policy value for

```
Computer Configuration >> Windows Settings >> Security Settings >> Advanced  
Audit Policy Configuration >> System Audit Policies >> System >> Audit  
Security System Extension with "Success" selected
```

References:

1. CIS Recommendation: Audit Security System Extension

1.99 WN22-CC-000050 (Automated)

Profile Applicability:

- DC SEVERITY: CAT III
- MS SEVERITY: CAT III

Description:

Windows Server 2022 must be configured to prevent Internet Control Message Protocol (ICMP) redirects from overriding Open Shortest Path First (OSPF)-generated routes.

```
GROUP ID: V-254337
RULE ID: SV-254337r991589
```

Rationale:

Allowing ICMP redirect of routes can lead to traffic not being routed properly. When disabled, this forces ICMP to be routed via the shortest path first.

Audit:

If the following registry value does not exist or is not configured as specified, this is a finding:

```
Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SYSTEM\CurrentControlSet\Services\Tcpip\Parameters\

Value Name: EnableICMPRedirect

Value Type: REG_DWORD
Value: 0x00000000 (0)
```

Remediation:

Configure the policy value for

```
Computer Configuration >> Administrative Templates >> MSS (Legacy) >> MSS:
(EnableICMPRedirect) Allow ICMP redirects to override OSPF generated routes
to "Disabled"
```

This policy setting requires the installation of the MSS-Legacy custom templates included with the STIG package. "MSS-Legacy.admx" and "MSS-Legacy.adml" must be copied to the \Windows\PolicyDefinitions and \Windows\PolicyDefinitions\en-US directories respectively.

References:

1. CIS Recommendation: MSS: (EnableICMPRedirect) Allow ICMP redirects to override OSPF generated routes

1.100 WN22-CC-000060 (Automated)

Profile Applicability:

- DC SEVERITY: CAT III
- MS SEVERITY: CAT III

Description:

Windows Server 2022 must be configured to ignore NetBIOS name release requests except from WINS servers.

GROUP ID: V-254338
RULE ID: SV-254338r958902

Rationale:

Configuring the system to ignore name release requests, except from WINS servers, prevents a denial of service (DoS) attack. The DoS consists of sending a NetBIOS name release request to the server for each entry in the server's cache, causing a response delay in the normal operation of the server's WINS resolution capability.

Audit:

If the following registry value does not exist or is not configured as specified, this is a finding:

Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SYSTEM\CurrentControlSet\Services\Netbt\Parameters\

Value Name: NoNameReleaseOnDemand

Value Type: REG_DWORD
Value: 0x00000001 (1)

Remediation:

Configure the policy value for

Computer Configuration >> Administrative Templates >> MSS (Legacy) >> MSS: (NoNameReleaseOnDemand) Allow the computer to ignore NetBIOS name release requests except from WINS servers to "Enabled"

This policy setting requires the installation of the MSS-Legacy custom templates included with the STIG package. "MSS-Legacy.admx" and "MSS-Legacy.adml" must be copied to the \Windows\PolicyDefinitions and \Windows\PolicyDefinitions\en-US directories respectively.

1.102 WN22-CC-000080 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 hardened Universal Naming Convention (UNC) paths must be defined to require mutual authentication and integrity for at least the *\\SYSVOL* and *\\NETLOGON* shares.

GROUP ID: V-254340
RULE ID: SV-254340r991589

Rationale:

Additional security requirements are applied to UNC paths specified in hardened UNC paths before allowing access to them. This aids in preventing tampering with or spoofing of connections to these paths.

Audit:

This requirement is applicable to domain-joined systems. For standalone or nondomain-joined systems, this is NA.

If the following registry values do not exist or are not configured as specified, this is a finding:

Registry Hive: HKEY_LOCAL_MACHINE
Registry Path:
\\SOFTWARE\\Policies\\Microsoft\\Windows\\NetworkProvider\\HardenedPaths\\

Value Name: *\\NETLOGON
Value Type: REG_SZ
Value: RequireMutualAuthentication=1, RequireIntegrity=1

Value Name: *\\SYSVOL
Value Type: REG_SZ
Value: RequireMutualAuthentication=1, RequireIntegrity=1

Additional entries would not be a finding.

Remediation:

Configure the policy value for

```
Computer Configuration >> Administrative Templates >> Network >> Network  
Provider >> Hardened UNC Paths" to "Enabled"
```

with at least the following configured in "Hardened UNC Paths" (click the "Show" button to display):

```
Value Name: \\*\SYSVOL  
Value: RequireMutualAuthentication=1, RequireIntegrity=1  
  
Value Name: \\*\NETLOGON  
Value: RequireMutualAuthentication=1, RequireIntegrity=1
```

1.103 WN22-CC-000090 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 command line data must be included in process creation events.

```
GROUP ID: V-254341
RULE ID: SV-254341r958422
```

Rationale:

Maintaining an audit trail of system activity logs can help identify configuration errors, troubleshoot service disruptions, and analyze compromises that have occurred, as well as detect attacks. Audit logs are necessary to provide a trail of evidence in case the system or network is compromised. Collecting this data is essential for analyzing the security of information assets and detecting signs of suspicious and unexpected behavior.

Enabling "Include command line data for process creation events" will record the command line information with the process creation events in the log. This can provide additional detail when malware has run on a system.

Audit:

If the following registry value does not exist or is not configured as specified, this is a finding:

```
Registry Hive: HKEY_LOCAL_MACHINE
Registry Path:
\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System\Audit\

Value Name: ProcessCreationIncludeCmdLine_Enabled

Value Type: REG_DWORD
Value: 0x00000001 (1)
```

Remediation:

Configure the policy value for

```
Computer Configuration >> Administrative Templates >> System >> Audit Process
Creation >> Include command line in process creation events to "Enabled"
```

References:

1. CIS Recommendation: Include command line in process creation events
2. GRID: MS-00000294

1.105 WN22-CC-000110 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 virtualization-based security must be enabled with the platform security level configured to Secure Boot or Secure Boot with DMA Protection.

GROUP ID: V-254343 RULE ID: SV-254343r991589

Rationale:

Virtualization Based Security (VBS) provides the platform for the additional security features Credential Guard and virtualization-based protection of code integrity. Secure Boot is the minimum security level, with DMA protection providing additional memory protection. DMA Protection requires a CPU that supports input/output memory management unit (IOMMU).

Audit:

For standalone or nondomain-joined systems, this is NA.

Open "PowerShell" with elevated privileges (run as administrator).

Enter the following:

```
"Get-CimInstance -ClassName Win32_DeviceGuard -Namespace  
root\Microsoft\Windows\DeviceGuard"
```

If "RequiredSecurityProperties" does not include a value of "2" indicating "Secure Boot" (e.g., "{1, 2}"), this is a finding.

If "Secure Boot and DMA Protection" is configured, "3" will also be displayed in the results (e.g., "{1, 2, 3}").

If "VirtualizationBasedSecurityStatus" is not a value of "2" indicating "Running", this is a finding.

Alternately:

Run "System Information".

Under "System Summary", verify the following:

If "Device Guard Virtualization based security" does not display "Running", this is a finding.

If "Device Guard Required Security Properties" does not display "Base Virtualization Support, Secure Boot", this is a finding.

If "Secure Boot and DMA Protection" is configured, "DMA Protection" will also be displayed (e.g., "Base Virtualization Support, Secure Boot, DMA Protection").

The policy settings referenced in the Fix section will configure the following registry values; however, due to hardware requirements, the registry values alone do not ensure proper function.

```
Registry Hive: HKEY_LOCAL_MACHINE  
Registry Path: \SOFTWARE\Policies\Microsoft\Windows\DeviceGuard\  
  
Value Name: EnableVirtualizationBasedSecurity  
Value Type: REG_DWORD  
Value: 0x00000001 (1)  
  
Value Name: RequirePlatformSecurityFeatures  
Value Type: REG_DWORD  
Value: 0x00000001 (1) (Secure Boot only) or 0x00000003 (3) (Secure Boot and  
DMA Protection)
```

A Microsoft TechNet article on Credential Guard, including system requirement details, can be found at the following link:

<https://technet.microsoft.com/itpro/windows/keep-secure/credential-guard>

Remediation:

Configure the policy value for

```
Computer Configuration >> Administrative Templates >> System >> Device Guard  
>> Turn On Virtualization Based Security to "Enabled" with "Secure Boot" or  
"Secure Boot and DMA Protection" selected
```

A Microsoft TechNet article on Credential Guard, including system requirement details, can be found at the following link:

1.106 WN22-CC-000130 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 Early Launch Antimalware, Boot-Start Driver Initialization Policy must prevent boot drivers identified as bad.

```
GROUP ID: V-254344  
RULE ID: SV-254344r991589
```

Rationale:

Compromised boot drivers can introduce malware prior to protection mechanisms that load after initialization. The Early Launch Antimalware driver can limit allowed drivers based on classifications determined by the malware protection application. At a minimum, drivers determined to be bad must not be allowed.

Audit:

The default behavior is for Early Launch Antimalware - Boot-Start Driver Initialization policy to enforce "Good, unknown and bad but critical" (preventing "bad").

If the registry value name below does not exist, this is not a finding.

If it exists and is configured with a value of "0x00000007 (7)", this is a finding.

```
Registry Hive: HKEY_LOCAL_MACHINE  
Registry Path: \SYSTEM\CurrentControlSet\Policies\EarlyLaunch\  
  
Value Name: DriverLoadPolicy  
  
Value Type: REG_DWORD  
Value: 0x00000001 (1), 0x00000003 (3), or 0x00000008 (8) (or if the Value  
Name does not exist)
```

Possible values for this setting are:

- 8 - Good only
- 1 - Good and unknown
- 3 - Good, unknown and bad but critical
- 7 - All (which includes "bad" and would be a finding)

Remediation:

The default behavior is for Early Launch Antimalware - Boot-Start Driver Initialization policy to enforce "Good, unknown and bad but critical" (preventing "bad").

If this needs to be corrected or a more secure setting is desired, configure the policy value for

```
Computer Configuration >> Administrative Templates >> System >> Early Launch Antimalware >> Boot-Start Driver Initialization Policy to "Not Configured" or "Enabled" with any option other than "All" selected
```

References:

1.107 WN22-CC-000140 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 group policy objects must be reprocessed even if they have not changed.

GROUP ID: V-254345
RULE ID: SV-254345r991589

Rationale:

Registry entries for group policy settings can potentially be changed from the required configuration. This could occur as part of troubleshooting or by a malicious process on a compromised system. Enabling this setting and then selecting the "Process even if the Group Policy objects have not changed" option ensures the policies will be reprocessed even if none have been changed. This way, any unauthorized changes are forced to match the domain-based group policy settings again.

Audit:

If the following registry value does not exist or is not configured as specified, this is a finding:

Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SOFTWARE\Policies\Microsoft\Windows\Group Policy\{35378EAC-683F-11D2-A89A-00C04FBBCFA2}\

Value Name: NoGPOListChanges

Type: REG_DWORD
Value: 0x00000000 (0)

Remediation:

Configure the policy value for

Computer Configuration >> Administrative Templates >> System >> Group Policy
>> Configure registry policy processing to "Enabled" with the option "Process even if the Group Policy objects have not changed" selected

References:

1. CIS Recommendation: Configure registry policy processing: Process even if the Group Policy objects have not changed

1.124 WN22-CC-000310 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 Explorer Data Execution Prevention must be enabled.

GROUP ID: V-254362
RULE ID: SV-254362r958928

Rationale:

Data Execution Prevention provides additional protection by performing checks on memory to help prevent malicious code from running. This setting will prevent Data Execution Prevention from being turned off for File Explorer.

Audit:

The default behavior is for Data Execution Prevention to be turned on for File Explorer.

If the registry value name below does not exist, this is not a finding.

If it exists and is configured with a value of "0", this is not a finding.

If it exists and is configured with a value of "1", this is a finding.

Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SOFTWARE\Policies\Microsoft\Windows\Explorer\

Value Name: NoDataExecutionPrevention

Value Type: REG_DWORD
Value: 0x00000000 (0) (or if the Value Name does not exist)

Remediation:

The default behavior is for data execution prevention to be turned on for File Explorer.

If this needs to be corrected, configure the policy value for

Computer Configuration >> Administrative Templates >> Windows Components >>
File Explorer >> Turn off Data Execution Prevention for Explorer to "Not
Configured" or "Disabled"

References:

1. CIS Recommendation: Turn off Data Execution Prevention for Explorer
2. GRID: MS-00000455

Additional Information:

CCI-002824

Implement organization-defined controls to protect its memory from unauthorized code execution.

1.125 WN22-CC-000320 (Automated)

Profile Applicability:

- DC SEVERITY: CAT III
- MS SEVERITY: CAT III

Description:

Windows Server 2022 Turning off File Explorer heap termination on corruption must be disabled.

```
GROUP ID: V-254363
RULE ID: SV-254363r991589
```

Rationale:

Legacy plug-in applications may continue to function when a File Explorer session has become corrupt. Disabling this feature will prevent this.

Audit:

The default behavior is for File Explorer heap termination on corruption to be enabled.

If the registry Value Name below does not exist, this is not a finding.

If it exists and is configured with a value of "0", this is not a finding.

If it exists and is configured with a value of "1", this is a finding.

```
Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SOFTWARE\Policies\Microsoft\Windows\Explorer\

Value Name: NoHeapTerminationOnCorruption

Value Type: REG_DWORD
Value: 0x00000000 (0) (or if the Value Name does not exist)
```

Remediation:

The default behavior is for File Explorer heap termination on corruption to be disabled.

If this needs to be corrected, configure the policy value for

```
Computer Configuration >> Administrative Templates >> Windows Components >>
File Explorer >> Turn off heap termination on corruption to "Not Configured"
or "Disabled"
```

References:

1. CIS Recommendation: Turn off heap termination on corruption

1.126 WN22-CC-000330 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 File Explorer shell protocol must run in protected mode.

GROUP ID: V-254364
RULE ID: SV-254364r991589

Rationale:

The shell protocol will limit the set of folders that applications can open when run in protected mode. Restricting files an application can open to a limited set of folders increases the security of Windows.

Audit:

The default behavior is for shell protected mode to be turned on for File Explorer.

If the registry value name below does not exist, this is not a finding.

If it exists and is configured with a value of "0", this is not a finding.

If it exists and is configured with a value of "1", this is a finding.

Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\Explorer\

Value Name: PreXPSP2ShellProtocolBehavior

Value Type: REG_DWORD
Value: 0x00000000 (0) (or if the Value Name does not exist)

Remediation:

The default behavior is for shell protected mode to be turned on for File Explorer.

If this needs to be corrected, configure the policy value for

Computer Configuration >> Administrative Templates >> Windows Components >>
File Explorer >> Turn off shell protocol protected mode to "Not Configured"
or "Disabled"

References:

1.130 WN22-CC-000370 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 Remote Desktop Services must require secure Remote Procedure Call (RPC) communications.

GROUP ID: V-254368
RULE ID: SV-254368r958408

Rationale:

Allowing unsecure RPC communication exposes the system to man-in-the-middle attacks and data disclosure attacks. A man-in-the-middle attack occurs when an intruder captures packets between a client and server and modifies them before allowing the packets to be exchanged. Usually the attacker will modify the information in the packets in an attempt to cause either the client or server to reveal sensitive information.

Satisfies: SRG-OS-000033-GPOS-00014, SRG-OS-000250-GPOS-00093

Audit:

If the following registry value does not exist or is not configured as specified, this is a finding:

1.141 WN22-CC-000480 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 Windows Remote Management (WinRM) client must not allow unencrypted traffic.

GROUP ID: V-254379
RULE ID: SV-254379r958848

Rationale:

Unencrypted remote access to a system can allow sensitive information to be compromised. Windows remote management connections must be encrypted to prevent this.

Satisfies: SRG-OS-000393-GPOS-00173, SRG-OS-000394-GPOS-00174

Audit:

If the following registry value does not exist or is not configured as specified, this is a finding:

Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SOFTWARE\Policies\Microsoft\Windows\WinRM\Client\

Value Name: AllowUnencryptedTraffic

Type: REG_DWORD
Value: 0x00000000 (0)

Remediation:

Configure the policy value for

Computer Configuration >> Administrative Templates >> Windows Components >> Windows Remote Management (WinRM) >> WinRM Client >> Allow unencrypted traffic to "Disabled"

References:

1. CIS Recommendation: Allow unencrypted traffic
2. GRID: MS-00000539

Additional Information:

CCI-002890

Implement organization-defined cryptographic mechanisms to protect the integrity of nonlocal maintenance and diagnostic communications.

- NIST SP 800-53 Revision 4 :: MA-4 (6)

1.142 WN22-CC-000490 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 Windows Remote Management (WinRM) client must not use Digest authentication.

```
GROUP ID: V-254380
RULE ID: SV-254380r958510
```

Rationale:

Digest authentication is not as strong as other options and may be subject to man-in-the-middle attacks. Disallowing Digest authentication will reduce this potential.

Audit:

If the following registry value does not exist or is not configured as specified, this is a finding:

```
Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SOFTWARE\Policies\Microsoft\Windows\WinRM\Client\

Value Name: AllowDigest

Type: REG_DWORD
Value: 0x00000000 (0)
```

Remediation:

Configure the policy value for

```
Computer Configuration >> Administrative Templates >> Windows Components >>
Windows Remote Management (WinRM) >> WinRM Client >> Disallow Digest
authentication to "Enabled"
```

References:

1. CIS Recommendation: Disallow Digest authentication
2. GRID: MS-00000540

1.146 WN22-CC-000530 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must have PowerShell Transcription enabled.

GROUP ID: V-254384
RULE ID: SV-254384r958420

Rationale:

Maintaining an audit trail of system activity logs can help identify configuration errors, troubleshoot service disruptions, and analyze compromises that have occurred, as well as detect attacks. Audit logs are necessary to provide a trail of evidence in case the system or network is compromised. Collecting this data is essential for analyzing the security of information assets and detecting signs of suspicious and unexpected behavior.

Enabling PowerShell Transcription will record detailed information from the processing of PowerShell commands and scripts. This can provide additional detail when malware has run on a system.

Audit:

If the following registry value does not exist or is not configured as specified, this is a finding:

Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SOFTWARE\Policies\Microsoft\Windows\PowerShell\Transcription\

Value Name: EnableTranscripting

Value Type: REG_DWORD
Value: 1

Remediation:

Configure the policy value for

Computer Configuration >> Administrative Templates >> Windows Components >> Windows PowerShell >> "Turn on PowerShell Transcription" to "Enabled"

Specify the Transcript output directory to point to a Central Log Server or another secure location to prevent user access.

References:

1. CIS Recommendation: Turn on PowerShell Transcription
2. GRID: MS-00000537

Additional Information:

CCI-000134

Ensure that audit records containing information that establishes the outcome of the event.

1.147 WN22-DC-000010 (Manual)

Profile Applicability:

- DC SEVERITY: CAT I

Description:

Windows Server 2022 must only allow administrators responsible for the domain controller to have Administrator rights on the system.

GROUP ID: V-254385 RULE ID: SV-254385r958726

Rationale:

An account that does not have Administrator duties must not have Administrator rights. Such rights would allow the account to bypass or modify required security restrictions on that machine and make it vulnerable to attack.

System administrators must log on to systems using only accounts with the minimum level of authority necessary.

Standard user accounts must not be members of the built-in Administrators group.

Audit:

This applies to domain controllers. A separate version applies to other systems.

Review the Administrators group. Only the appropriate administrator groups or accounts responsible for administration of the system may be members of the group.

Standard user accounts must not be members of the local administrator group.

If prohibited accounts are members of the local administrators group, this is a finding.

If the built-in Administrator account or other required administrative accounts are found on the system, this is not a finding.

Remediation:

Configure the Administrators group to include only administrator groups or accounts that are responsible for the system.

Remove any standard user accounts.

Additional Information:

CCI-002235

Prevent non-privileged users from executing privileged functions.

- NIST SP 800-53 Revision 5 :: AC-6 (10)

1.148 WN22-DC-000020 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II

Description:

Windows Server 2022 Kerberos user logon restrictions must be enforced.

GROUP ID: V-254386
RULE ID: SV-254386r1051101

Rationale:

This policy setting determines whether the Kerberos Key Distribution Center (KDC) validates every request for a session ticket against the user rights policy of the target computer. The policy is enabled by default, which is the most secure setting for validating that access to target resources is not circumvented.

Audit:

This applies to domain controllers. It is NA for other systems.

Verify the following is configured in the Default Domain Policy:

Open "Group Policy Management".

Navigate to "Group Policy Objects" in the Domain being reviewed (Forest >> Domains >> Domain).

Right-click on the "Default Domain Policy".

Select "Edit".

Navigate to

Computer Configuration >> Policies >> Windows Settings >> Security Settings
>> Account Policies >> Kerberos Policy

If the "Enforce user logon restrictions" is not set to "Enabled", this is a finding.

Remediation:

Configure the policy value in the Default Domain Policy for

Computer Configuration >> Policies >> Windows Settings >> Security Settings
>> Account Policies >> Kerberos Policy >> Enforce user logon restrictions to
"Enabled"

Additional Information:

1.149 WN22-DC-000030 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II

Description:

Windows Server 2022 Kerberos service ticket maximum lifetime must be limited to 600 minutes or less.

GROUP ID: V-254387 RULE ID: SV-254387r1051102
--

Rationale:

This setting determines the maximum amount of time (in minutes) that a granted session ticket can be used to access a particular service. Session tickets are used only to authenticate new connections with servers. Ongoing operations are not interrupted if the session ticket used to authenticate the connection expires during the connection.

Satisfies: SRG-OS-000112-GPOS-00057, SRG-OS-000113-GPOS-00058

Audit:

This applies to domain controllers. It is NA for other systems.

Verify the following is configured in the Default Domain Policy:

Open "Group Policy Management".

Navigate to "Group Policy Objects" in the Domain being reviewed (Forest >> Domains >> Domain).

Right-click on the "Default Domain Policy".

Select "Edit".

Navigate to

Computer Configuration >> Policies >> Windows Settings >> Security Settings >> Account Policies >> Kerberos Policy.
--

If the value for "Maximum lifetime for service ticket" is "0" or greater than "600" minutes, this is a finding.

Remediation:

Configure the policy value in the Default Domain Policy for

```
Computer Configuration >> Policies >> Windows Settings >> Security Settings  
>> Account Policies >> Kerberos Policy >> Maximum lifetime for service ticket  
to a maximum of "600" minutes, but not "0", which equates to "Ticket doesn't  
expire"
```

1.150 WN22-DC-000040 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II

Description:

Windows Server 2022 Kerberos user ticket lifetime must be limited to 10 hours or less.

GROUP ID: V-254388
RULE ID: SV-254388r1051103

Rationale:

In Kerberos, there are two types of tickets: Ticket Granting Tickets (TGTs) and Service Tickets. Kerberos tickets have a limited lifetime so the time an attacker has to implement an attack is limited. This policy controls how long TGTs can be renewed. With Kerberos, the user's initial authentication to the domain controller results in a TGT, which is then used to request Service Tickets to resources. Upon startup, each computer gets a TGT before requesting a service ticket to the domain controller and any other computers it needs to access. For services that start up under a specified user account, users must always get a TGT first and then get Service Tickets to all computers and services accessed.

Satisfies: SRG-OS-000112-GPOS-00057, SRG-OS-000113-GPOS-00058

Audit:

This applies to domain controllers. It is NA for other systems.

Verify the following is configured in the Default Domain Policy:

Open "Group Policy Management".

Navigate to "Group Policy Objects" in the Domain being reviewed (Forest >> Domains >> Domain).

Right-click on the "Default Domain Policy".

Select "Edit".

Navigate to

Computer Configuration >> Policies >> Windows Settings >> Security Settings
>> Account Policies >> Kerberos Policy

If the value for "Maximum lifetime for user ticket" is "0" or greater than "10" hours, this is a finding.

Remediation:

Configure the policy value in the Default Domain Policy for

```
Computer Configuration >> Policies >> Windows Settings >> Security Settings  
>> Account Policies >> Kerberos Policy >> Maximum lifetime for user ticket to  
a maximum of "10" hours but not "0", which equates to "Ticket doesn't expire"
```

1.151 WN22-DC-000050 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II

Description:

Windows Server 2022 Kerberos policy user ticket renewal maximum lifetime must be limited to seven days or less.

GROUP ID: V-254389 RULE ID: SV-254389r1051104
--

Rationale:

This setting determines the period of time (in days) during which a user's Ticket Granting Ticket (TGT) may be renewed. This security configuration limits the amount of time an attacker has to crack the TGT and gain access.

Satisfies: SRG-OS-000112-GPOS-00057, SRG-OS-000113-GPOS-00058

Audit:

This applies to domain controllers. It is NA for other systems.

Verify the following is configured in the Default Domain Policy:

Open "Group Policy Management".

Navigate to "Group Policy Objects" in the Domain being reviewed (Forest >> Domains >> Domain).

Right-click on the "Default Domain Policy".

Select "Edit".

Navigate to

Computer Configuration >> Policies >> Windows Settings >> Security Settings >> Account Policies >> Kerberos Policy

If the "Maximum lifetime for user ticket renewal" is greater than "7" days, this is a finding.

Remediation:

Configure the policy value in the Default Domain Policy for

Computer Configuration >> Policies >> Windows Settings >> Security Settings
>> Account Policies >> Kerberos Policy >> Maximum lifetime for user ticket
renewal to a maximum of "7" days or less

1.152 WN22-DC-000060 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II

Description:

Windows Server 2022 computer clock synchronization tolerance must be limited to five minutes or less.

GROUP ID: V-254390 RULE ID: SV-254390r1051105
--

Rationale:

This setting determines the maximum time difference (in minutes) that Kerberos will tolerate between the time on a client's clock and the time on a server's clock while still considering the two clocks synchronous. To prevent replay attacks, Kerberos uses timestamps as part of its protocol definition. For timestamps to work properly, the clocks of the client and the server need to be in sync as much as possible.

Satisfies: SRG-OS-000112-GPOS-00057, SRG-OS-000113-GPOS-00058

Audit:

This applies to domain controllers. It is NA for other systems.

Verify the following is configured in the Default Domain Policy:

Open "Group Policy Management".

Navigate to "Group Policy Objects" in the Domain being reviewed (Forest >> Domains >> Domain).

Right-click on the "Default Domain Policy".

Select "Edit".

Navigate to

Computer Configuration >> Policies >> Windows Settings >> Security Settings >> Account Policies >> Kerberos Policy

If the "Maximum tolerance for computer clock synchronization" is greater than "5" minutes, this is a finding.

Remediation:

Configure the policy value in the Default Domain Policy for

Computer Configuration >> Windows Settings >> Security Settings >> Account Policies >> Kerberos Policy >> Maximum tolerance for computer clock synchronization to a maximum of "5" minutes or less

Additional Information:

CCI-001941

Implement replay-resistant authentication mechanisms for access to privileged accounts and/or non-privileged accounts.

- NIST SP 800-53 Revision 4 :: IA-2 (9)

1.153 WN22-DC-000070 (Manual)

Profile Applicability:

- DC SEVERITY: CAT I

Description:

Windows Server 2022 permissions on the Active Directory data files must only allow System and Administrators access.

GROUP ID: V-254391 RULE ID: SV-254391r958726

Rationale:

Improper access permissions for directory data-related files could allow unauthorized users to read, modify, or delete directory data or audit trails.

Satisfies: SRG-OS-000324-GPOS-00125, SRG-OS-000206-GPOS-00084

Audit:

This applies to domain controllers. It is NA for other systems.

Run "Regedit".

Navigate to

```
"HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\NTDS\Parameters"
```

Note the directory locations in the values for:

Database log files path

DSA Database file

By default, they will be \Windows\NTDS.

If the locations are different, the following will need to be run for each.

Open "Command Prompt (Admin)".

Navigate to the NTDS directory (\Windows\NTDS by default).

Run "icacls .".

If the permissions on each file are not as restrictive as the following, this is a finding:

```
NT AUTHORITY\SYSTEM:(I)(F)
BUILTIN\Administrators:(I)(F)

(I) - permission inherited from parent container
(F) - full access
```

Remediation:

Maintain the permissions on NTDS database and log files as follows:

```
NT AUTHORITY\SYSTEM:(I)(F)
BUILTIN\Administrators:(I)(F)

(I) - permission inherited from parent container
(F) - full access
```

Additional Information:

1.154 WN22-DC-000080 (Manual)

Profile Applicability:

- DC SEVERITY: CAT I

Description:

Windows Server 2022 Active Directory SYSVOL directory must have the proper access control permissions.

GROUP ID: V-254392 RULE ID: SV-254392r958726

Rationale:

Improper access permissions for directory data files could allow unauthorized users to read, modify, or delete directory data.

The SYSVOL directory contains public files (to the domain) such as policies and logon scripts. Data in shared subdirectories are replicated to all domain controllers in a domain.

Audit:

This applies to domain controllers. It is NA for other systems.

Open a command prompt.

Run "net share".

Make note of the directory location of the SYSVOL share.

By default, this will be \Windows\SYSVOL\sysvol. For this requirement, permissions will be verified at the first SYSVOL directory level.

If any standard user accounts or groups have greater than "Read & execute" permissions, this is a finding.

The default permissions noted below meet this requirement:

Open "Command Prompt".

Run "icacls c:\Windows\SYSVOL".

The following results must be displayed:

- NT AUTHORITY\Authenticated Users:(RX)
- NT AUTHORITY\Authenticated Users:(OI)(CI)(IO)(GR,GE)
- BUILTIN\Server Operators:(RX)
- BUILTIN\Server Operators:(OI)(CI)(IO)(GR,GE)
- BUILTIN\Administrators:(M,WDAC,WO)
- BUILTIN\Administrators:(OI)(CI)(IO)(F)
- NT AUTHORITY\SYSTEM:(F)
- NT AUTHORITY\SYSTEM:(OI)(CI)(IO)(F)
- CREATOR OWNER:(OI)(CI)(IO)(F)

(RX) - Read & execute

Run "icacls /help" to view definitions of other permission codes.

Remediation:

Maintain the permissions on the SYSVOL directory. Do not allow greater than "Read & execute" permissions for standard user accounts or groups. The defaults below meet this requirement:

C:\Windows\SYSVOL

Type - "Allow" for all

Inherited from - "None" for all

Principal - Access - Applies to

- Authenticated Users - Read & execute - This folder, subfolder, and files
- Server Operators - Read & execute- This folder, subfolder, and files
- Administrators - Special - This folder only (Special = Basic Permissions: all selected except Full control)
- CREATOR OWNER - Full control - Subfolders and files only
- Administrators - Full control - Subfolders and files only
- SYSTEM - Full control - This folder, subfolders, and files

Additional Information:

CCI-002235

Prevent non-privileged users from executing privileged functions.

- NIST SP 800-53 Revision 4 :: AC-6 (10)
- NIST SP 800-53 Revision 5 :: AC-6 (10)

1.155 WN22-DC-000090 (Manual)

Profile Applicability:

- DC SEVERITY: CAT I

Description:

Windows Server 2022 Active Directory Group Policy objects must have proper access control permissions.

GROUP ID: V-254393 RULE ID: SV-254393r1081073
--

Rationale:

When directory service database objects do not have appropriate access control permissions, it may be possible for malicious users to create, read, update, or delete the objects and degrade or destroy the integrity of the data. When the directory service is used for identification, authentication, or authorization functions, a compromise of the database objects could lead to a compromise of all systems relying on the directory service.

For Active Directory (AD), the Group Policy objects require special attention. In a distributed administration model (i.e., help desk), Group Policy objects are more likely to have access permissions changed from the secure defaults. If inappropriate access permissions are defined for Group Policy objects, this could allow an intruder to change the security policy applied to all domain client computers (workstations and servers).

Audit:

This applies to domain controllers. It is NA for other systems.

Review the permissions on Group Policy objects.

Open "Group Policy Management" (available from various menus or run "gpmc.msc").

Navigate to "Group Policy Objects" in the domain being reviewed (Forest >> Domains >> Domain).

For each Group Policy object:

Select the Group Policy object item in the left pane.

Select the "Delegation" tab in the right pane.

Select "Advanced".

Select each Group or user name.

View the permissions.

If any standard user accounts or groups have "Allow" permissions greater than "Read" and "Apply group policy", this is a finding.

Other access permissions that allow the objects to be updated are considered findings unless specifically documented by the Information System Security Officer (ISSO).

The default permissions noted below satisfy this requirement.

The permissions shown are at the summary level. More detailed permissions can be viewed by selecting the next "Advanced" button, the desired Permission entry, and the "Edit" button.

Authenticated Users - Read, Apply group policy, Special permissions

The special permissions for Authenticated Users are for Read-type Properties. If detailed permissions include any Create, Delete, Modify, or Write Permissions or Properties, this is a finding.

The special permissions for the following default groups are not the focus of this requirement and may include a wide range of permissions and properties:

- CREATOR OWNER - Special permissions
- SYSTEM - Read, Write, Create all child objects, Delete all child objects, Special permissions
- Domain Admins - Read, Write, Create all child objects, Delete all child objects, Special permissions
- Enterprise Admins - Read, Write, Create all child objects, Delete all child objects, Special permissions
- ENTERPRISE DOMAIN CONTROLLERS - Read, Special permissions

Remediation:

Maintain the permissions on Group Policy objects to not allow greater than "Read" and "Apply group policy" for standard user accounts or groups. The default permissions below meet this requirement:

Authenticated Users - Read, Apply group policy, Special permissions

The special permissions for Authenticated Users are for Read-type Properties.

- CREATOR OWNER - Special permissions
- SYSTEM - Read, Write, Create all child objects, Delete all child objects, Special permissions
- Domain Admins - Read, Write, Create all child objects, Delete all child objects, Special permissions
- Enterprise Admins - Read, Write, Create all child objects, Delete all child objects, Special permissions
- ENTERPRISE DOMAIN CONTROLLERS - Read, Special permissions

Document any other access permissions that allow the objects to be updated with the ISSO.

Additional Information:

- NIST SP 800-53 Revision 5 :: AC-6 (10)

1.156 WN22-DC-000100 (Manual)

Profile Applicability:

- DC SEVERITY: CAT I

Description:

Windows Server 2022 Active Directory Domain Controllers Organizational Unit (OU) object must have the proper access control permissions.

GROUP ID: V-254394 RULE ID: SV-254394r958726

Rationale:

When Active Directory objects do not have appropriate access control permissions, it may be possible for malicious users to create, read, update, or delete the objects and degrade or destroy the integrity of the data. When the directory service is used for identification, authentication, or authorization functions, a compromise of the database objects could lead to a compromise of all systems that rely on the directory service.

The Domain Controllers OU object requires special attention as the Domain Controllers are central to the configuration and management of the domain. Inappropriate access permissions defined for the Domain Controllers OU could allow an intruder or unauthorized personnel to make changes that could lead to the compromise of the domain.

Audit:

This applies to domain controllers. It is NA for other systems.

Review the permissions on the Domain Controllers OU.

Open "Active Directory Users and Computers" (available from various menus or run "dsa.msc").

Select "Advanced Features" in the "View" menu if not previously selected.

Select the "Domain Controllers" OU (folder in folder icon).

Right-click and select "Properties".

Select the "Security" tab.

If the permissions on the Domain Controllers OU do not restrict changes to System, Domain Admins, Enterprise Admins and Administrators, this is a finding.

The default permissions listed below satisfy this requirement.

Domains supporting Microsoft Exchange will have additional Exchange related permissions on the Domain Controllers OU. These may include some change related permissions and are not a finding.

The permissions shown are at the summary level. More detailed permissions can be viewed by selecting the "Advanced" button, the desired Permission entry, and the "View" or "Edit" button.

Except where noted otherwise, the special permissions may include a wide range of permissions and properties and are acceptable for this requirement.

CREATOR OWNER - Special permissions

SELF - Special permissions

Authenticated Users - Read, Special permissions

The special permissions for Authenticated Users are Read types.

If detailed permissions include any Create, Delete, Modify, or Write Permissions or Properties, this is a finding.

SYSTEM - Full Control

Domain Admins - Read, Write, Create all child objects, Generate resultant set of policy (logging), Generate resultant set of policy (planning), Special permissions

Enterprise Admins - Full Control

Key Admins - Special permissions

Enterprise Key Admins - Special permissions

Administrators - Read, Write, Create all child objects, Generate resultant set of policy (logging), Generate resultant set of policy (planning), Special permissions

Pre-Windows 2000 Compatible Access - Special permissions

The Special permissions for Pre-Windows 2000 Compatible Access are Read types.

If detailed permissions include any Create, Delete, Modify, or Write Permissions or Properties, this is a finding.

ENTERPRISE DOMAIN CONTROLLERS - Read, Special permissions

Remediation:

Limit the permissions on the Domain Controllers OU to restrict changes to System, Domain Admins, Enterprise Admins and Administrators.

The default permissions listed below satisfy this requirement.

Domains supporting Microsoft Exchange will have additional Exchange related permissions on the Domain Controllers OU. These may include some change related permissions.

CREATOR OWNER - Special permissions

SELF - Special permissions

Authenticated Users - Read, Special permissions

The special permissions for Authenticated Users are Read types.

SYSTEM - Full Control

Domain Admins - Read, Write, Create all child objects, Generate resultant set of policy (logging), Generate resultant set of policy (planning), Special permissions

Enterprise Admins - Full Control

Key Admins - Special permissions

Enterprise Key Admins - Special permissions

Administrators - Read, Write, Create all child objects, Generate resultant set of policy (logging), Generate resultant set of policy (planning), Special permissions

Pre-Windows 2000 Compatible Access - Special permissions

The special permissions for Pre-Windows 2000 Compatible Access are Read types.

ENTERPRISE DOMAIN CONTROLLERS - Read, Special permissions

Additional Information:

CCI-002235

Prevent non-privileged users from executing privileged functions.

- NIST SP 800-53 Revision 4 :: AC-6 (10)
- NIST SP 800-53 Revision 5 :: AC-6 (10)

1.157 WN22-DC-000110 (Manual)

Profile Applicability:

- DC SEVERITY: CAT I

Description:

Windows Server 2022 organization created Active Directory Organizational Unit (OU) objects must have proper access control permissions.

GROUP ID: V-254395 RULE ID: SV-254395r958726

Rationale:

When directory service database objects do not have appropriate access control permissions, it may be possible for malicious users to create, read, update, or delete the objects and degrade or destroy the integrity of the data. When the directory service is used for identification, authentication, or authorization functions, a compromise of the database objects could lead to a compromise of all systems that rely on the directory service.

For Active Directory, the OU objects require special attention. In a distributed administration model (i.e., help desk), OU objects are more likely to have access permissions changed from the secure defaults. If inappropriate access permissions are defined for OU objects, it could allow an intruder to add or delete users in the OU. This could result in unauthorized access to data or a denial of service (DoS) to authorized users.

Audit:

This applies to domain controllers. It is NA for other systems.

Review the permissions on domain-defined OUs.

Open "Active Directory Users and Computers" (available from various menus or run "dsa.msc").

Ensure "Advanced Features" is selected in the "View" menu.

For each OU that is defined (folder in folder icon) excluding the Domain Controllers OU:

Right-click the OU and select "Properties".

Select the "Security" tab.

If the Allow type permissions on the OU are not at least as restrictive as those below, this is a finding.

The permissions shown are at the summary level. More detailed permissions can be viewed by selecting the "Advanced" button, the desired Permission entry, and the "Edit" or "View" button.

Except where noted otherwise, the special permissions may include a wide range of permissions and properties and are acceptable for this requirement.

- CREATOR OWNER - Special permissions
- Self - Special permissions
- Authenticated Users - Read, Special permissions

The Special permissions for Authenticated Users are Read type. If detailed permissions include any Create, Delete, Modify, or Write Permissions or Properties, this is a finding.

- SYSTEM - Full Control
- Domain Admins - Full Control
- Enterprise Admins - Full Control
- Key Admins - Special permissions
- Enterprise Key Admins - Special permissions
- Administrators - Read, Write, Create all child objects, Generate resultant set of policy (logging), Generate resultant set of policy (planning), Special permissions
- Pre-Windows 2000 Compatible Access - Special permissions

The Special permissions for Pre-Windows 2000 Compatible Access are for Read types. If detailed permissions include any Create, Delete, Modify, or Write Permissions or Properties, this is a finding.

ENTERPRISE DOMAIN CONTROLLERS - Read, Special permissions

If an Information System Security Officer (ISSO)-approved distributed administration model (help desk or other user support staff) is implemented, permissions above Read may be allowed for groups documented by the ISSO.

If any OU with improper permissions includes identification or authentication data (e.g., accounts, passwords, or password hash data) used by systems to determine access control, the severity is CAT I (e.g., OUs that include user accounts, including service/application accounts).

If an OU with improper permissions does not include identification and authentication data used by systems to determine access control, the severity is CAT II (e.g., Workstation, Printer OUs).

Remediation:

Maintain the Allow type permissions on domain-defined OUs to be at least as restrictive as the defaults below.

Document any additional permissions above Read with the ISSO if an approved distributed administration model (help desk or other user support staff) is implemented.

- CREATOR OWNER - Special permissions
- Self - Special permissions
- Authenticated Users - Read, Special permissions

The special permissions for Authenticated Users are Read type.

- SYSTEM - Full Control
- Domain Admins - Full Control
- Enterprise Admins - Full Control
- Key Admins - Special permissions
- Enterprise Key Admins - Special permissions
- Administrators - Read, Write, Create all child objects, Generate resultant set of policy (logging), Generate resultant set of policy (planning), Special permissions
- Pre-Windows 2000 Compatible Access - Special permissions

The special permissions for Pre-Windows 2000 Compatible Access are for Read types.

- ENTERPRISE DOMAIN CONTROLLERS - Read, Special permissions

Additional Information:

CCI-002235

Prevent non-privileged users from executing privileged functions.

- NIST SP 800-53 Revision 4 :: AC-6 (10)
- NIST SP 800-53 Revision 5 :: AC-6 (10)

1.158 WN22-DC-000120 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II

Description:

Windows Server 2022 data files owned by users must be on a different logical partition from the directory server data files.

GROUP ID: V-254396
RULE ID: SV-254396r958524

Rationale:

When directory service data files, especially for directories used for identification, authentication, or authorization, reside on the same logical partition as user-owned files, the directory service data may be more vulnerable to unauthorized access or other availability compromises. Directory service and user-owned data files sharing a partition may be configured with less restrictive permissions in order to allow access to the user data.

The directory service may be vulnerable to a denial of service attack when user-owned files on a common partition are expanded to an extent preventing the directory service from acquiring more space for directory or audit data.

Audit:

This applies to domain controllers. It is NA for other systems.

Run "Regedit".

Navigate to

"HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\NTDS\Parameters"

Note the directory locations in the values for "DSA Database file".

Open "Command Prompt".

Enter

"net share"

Note the logical drive(s) or file system partition for any organization-created data shares.

Ignore system shares (e.g., NETLOGON, SYSVOL, and administrative shares ending in \$). User shares that are hidden (ending with \$) must not be ignored.

If user shares are located on the same logical partition as the directory server data files, this is a finding.

Remediation:

Move shares used to store files owned by users to a different logical partition than the directory server data files.

Additional Information:

CCI-001090

Prevent unauthorized and unintended information transfer via shared system resources.

- NIST SP 800-53 :: SC-4
- NIST SP 800-53 Revision 4 :: SC-4

1.159 WN22-DC-000130 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II

Description:

Windows Server 2022 domain controllers must run on a machine dedicated to that function.

GROUP ID: V-254397 RULE ID: SV-254397r958478

Rationale:

Executing application servers on the same host machine with a directory server may substantially weaken the security of the directory server. Web or database server applications usually require the addition of many programs and accounts, increasing the attack surface of the computer.

Some applications require the addition of privileged accounts, providing potential sources of compromise. Some applications (such as Microsoft Exchange) may require the use of network ports or services conflicting with the directory server. In this case, nonstandard ports might be selected, and this could interfere with intrusion detection or prevention services.

Audit:

This applies to domain controllers, it is NA for other systems.

Review the installed roles the domain controller is supporting.

Start "Server Manager".

Select "AD DS" in the left pane and the server name under "Servers" to the right.

Select "Add (or Remove) Roles and Features" from "Tasks" in the "Roles and Features" section. (Cancel before any changes are made.)

Determine if any additional server roles are installed. A basic domain controller setup will include the following:

- Active Directory Domain Services
- DNS Server
- File and Storage Services

If any roles not requiring installation on a domain controller are installed, this is a finding.

A Domain Name System (DNS) server integrated with the directory server (e.g., AD-integrated DNS) is an acceptable application. However, the DNS server must comply with the DNS STIG security requirements.

Run "Programs and Features".

Review installed applications.

If any applications are installed that are not required for the domain controller, this is a finding.

Remediation:

Remove additional roles or applications such as web, database, and email from the domain controller.

Additional Information:

CCI-000381

Configure the system to provide only organization-defined mission essential capabilities.

- NIST SP 800-53 :: CM-7

1.160 WN22-DC-000140 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II

Description:

Windows Server 2022 must use separate, NSA-approved (Type 1) cryptography to protect the directory data in transit for directory service implementations at a classified confidentiality level when replication data traverses a network cleared to a lower level than the data.

GROUP ID: V-254398 RULE ID: SV-254398r987791

Rationale:

Directory data that is not appropriately encrypted is subject to compromise. Commercial-grade encryption does not provide adequate protection when the classification level of directory data in transit is higher than the level of the network.

Audit:

This applies to domain controllers. It is NA for other systems.

Review the organization network diagram(s) or documentation to determine the level of classification for the network(s) over which replication data is transmitted.

Determine the classification level of the Windows domain controller.

If the classification level of the Windows domain controller is higher than the level of the networks, review the organization network diagram(s) and directory implementation documentation to determine if NSA-approved encryption is used to protect the replication network traffic.

If the classification level of the Windows domain controller is higher than the level of the network traversed and NSA-approved encryption is not used, this is a finding.

Remediation:

Configure NSA-approved (Type 1) cryptography to protect the directory data in transit for directory service implementations at a classified confidentiality level that transfer replication data through a network cleared to a lower level than the data.

Additional Information:

CCI-002450

Implement organization-defined types of cryptography for each specified cryptography use.

- NIST SP 800-53 Revision 4 :: SC-13
- NIST SP 800-53 Revision 5 :: SC-13 b

1.161 WN22-DC-000150 (Manual)

Profile Applicability:

- DC SEVERITY: CAT I

Description:

Windows Server 2022 directory data (outside the root DSE) of a nonpublic directory must be configured to prevent anonymous access.

GROUP ID: V-254399 RULE ID: SV-254399r991589

Rationale:

To the extent that anonymous access to directory data (outside the root DSE) is permitted, read access control of the data is effectively disabled. If other means of controlling access (such as network restrictions) are compromised, there may be nothing else to protect the confidentiality of sensitive directory data.

Audit:

This applies to domain controllers. It is NA for other systems.

Open "Command Prompt" (not elevated).

Run "ldp.exe".

From the "Connection menu", select "Bind".

Clear the User, Password, and Domain fields.

Select "Simple bind" for the Bind type and click "OK".

Confirmation of anonymous access will be displayed at the end:

```
res = ldap_simple_bind_s
```

Authenticated as: 'NT AUTHORITY\ANONYMOUS LOGON'

From the "Browse" menu, select "Search".

In the Search dialog, enter the DN of the domain naming context (generally something like "dc=disaost,dc=mil") in the Base DN field.

Clear the Attributes field and select "Run".

Error messages must display related to Bind and user not authenticated.

If attribute data is displayed, anonymous access is enabled to the domain naming context and this is a finding.

The following network controls allow the finding severity to be downgraded to a CAT II since these measures lower the risk associated with anonymous access.

Network hardware ports at the site are subject to 802.1x authentication or MAC address restrictions.

Premise firewall or host restrictions prevent access to ports 389, 636, 3268, and 3269 from client hosts not explicitly identified by domain (.mil) or IP address.

Remediation:

Configure directory data (outside the root DSE) of a nonpublic directory to prevent anonymous access.

For AD, there are multiple configuration items that could enable anonymous access.

Changing the access permissions on the domain naming context object (from the secure defaults) could enable anonymous access. If the check procedures indicate this is the cause, the process that was used to change the permissions must be reversed. This could have been through the Windows Support Tools ADSI Edit console (adsiedit.msc).

The dsHeuristics option is used. This is addressed in check V-8555 in the AD Forest STIG.

Additional Information:

CCI-000366

Implement the security configuration settings.

- NIST SP 800-53 :: CM-6 b
- NIST SP 800-53 Revision 4 :: CM-6 b
- NIST SP 800-53 Revision 5 :: CM-6 b
- NIST SP 800-53A :: CM-6.1 (iv)

1.162 WN22-DC-000160 (Manual)

Profile Applicability:

- DC SEVERITY: CAT III

Description:

Windows Server 2022 directory service must be configured to terminate LDAP-based network connections to the directory server after five minutes of inactivity.

GROUP ID: V-254400 RULE ID: SV-254400r970703

Rationale:

The failure to terminate inactive network connections increases the risk of a successful attack on the directory server. The longer an established session is in progress, the more time an attacker has to hijack the session, implement a means to passively intercept data, or compromise any protections on client access. For example, if an attacker gains control of a client computer, an existing (already authenticated) session with the directory server could allow access to the directory. The lack of confidentiality protection in LDAP-based sessions increases exposure to this vulnerability.

Satisfies: SRG-OS-000163-GPOS-00072, SRG-OS-000279-GPOS-00109

Audit:

This applies to domain controllers. It is NA for other systems.

Open an elevated "Command Prompt" (run as administrator).

Enter

```
"ntdsutil"
```

At the "ntdsutil:" prompt, enter

```
"LDAP policies"
```

At the "ldap policy:" prompt, enter

```
"connections"
```

At the "server connections:" prompt, enter

```
"connect to server [host-name]"
```

(where [host-name] is the computer name of the domain controller).

At the "server connections:" prompt, enter

```
"q"
```

At the "ldap policy:" prompt, enter

"show values".

If the value for MaxConnIdleTime is greater than "300" (5 minutes) or is not specified, this is a finding.

Enter "q" at the "ldap policy:" and "ntdsutil:" prompts to exit.

Alternately, Dsquery can be used to display MaxConnIdleTime:

Open "Command Prompt (Admin)".

Enter the following command (on a single line).

```
dsquery * "cn=Default Query Policy,cn=Query-Policies,cn=Directory Service,  
cn=Windows NT,cn=Services,cn=Configuration,dc=[forest-name]" -attr  
LDAPAdminLimits
```

The quotes are required and dc=[forest-name] is the fully qualified LDAP name of the domain being reviewed (e.g., dc=disaost,dc=mil).

If the results do not specify a "MaxConnIdleTime" or it has a value greater than "300" (5 minutes), this is a finding.

Remediation:

Configure the directory service to terminate LDAP-based network connections to the directory server after 5 minutes of inactivity.

Open an elevated "Command prompt" (run as administrator).

Enter

```
"ntdsutil"
```

At the "ntdsutil:" prompt, enter

```
"LDAP policies"
```

At the "ldap policy:" prompt, enter

```
"connections"
```

At the "server connections:" prompt, enter

```
"connect to server [host-name]"
```

(where [host-name] is the computer name of the domain controller).

At the "server connections:" prompt, enter

```
"q"
```

At the "ldap policy:" prompt, enter

```
"Set MaxConnIdleTime to 300"
```

Enter "Commit Changes" to save.

Enter "Show values" to verify changes.

Enter

```
"q"
```

at the "ldap policy:" and "ntdsutil:" prompts to exit.

1.163 WN22-DC-000170 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II

Description:

Windows Server 2022 Active Directory Group Policy objects must be configured with proper audit settings.

GROUP ID: V-254401 RULE ID: SV-254401r958732

Rationale:

When inappropriate audit settings are configured for directory service database objects, it may be possible for a user or process to update the data without generating any tracking data. The impact of missing audit data is related to the type of object. A failure to capture audit data for objects used by identification, authentication, or authorization functions could degrade or eliminate the ability to track changes to access policy for systems or data.

For Active Directory (AD), there are a number of critical object types in the domain naming context of the AD database for which auditing is essential. This includes Group Policy objects. Because changes to these objects can significantly impact access controls or the availability of systems, the absence of auditing data makes it impossible to identify the source of changes that impact the confidentiality, integrity, and availability of data and systems throughout an AD domain. The lack of proper auditing can result in insufficient forensic evidence needed to investigate an incident and prosecute the intruder.

Satisfies: SRG-OS-000327-GPOS-00127, SRG-OS-000458-GPOS-00203

Audit:

This applies to domain controllers. It is NA for other systems.

Review the auditing configuration for all Group Policy objects.

Open "Group Policy Management" (available from various menus or run "gpmc.msc").

Navigate to "Group Policy Objects" in the domain being reviewed (Forest >> Domains >> Domain).

For each Group Policy object:

Select the Group Policy object item in the left pane.

Select the "Delegation" tab in the right pane.

Select "Advanced".

Select "Advanced" again and then the "Auditing" tab.

If the audit settings for any Group Policy object are not at least as inclusive as those below, this is a finding:

- Type - Fail
- Principal - Everyone
- Access - Full Control
- Applies to - This object and all descendant objects or Descendant groupPolicyContainer objects

The three Success types listed below are defaults inherited from the Parent Object. Where Special is listed in the summary screens for Access, detailed Permissions are provided for reference.

- Type - Success
- Principal - Everyone
- Access - Special (Permissions: Write all properties, Modify permissions; Properties: all "Write" type selected)
- Inherited from - Parent Object
- Applies to - Descendant groupPolicyContainer objects

Two instances with the following summary information will be listed:

- Type - Success
- Principal - Everyone
- Access - blank (Permissions: none selected; Properties: one instance - Write gPLink, one instance - Write gPOptions)
- Inherited from - Parent Object
- Applies to - Descendant Organization Unit Objects

Remediation:

Configure the audit settings for Group Policy objects to include the following:

This can be done at the Policy level in Active Directory to apply to all group policies.

Open "Active Directory Users and Computers" (available from various menus or run "dsa.msc").

Select "Advanced Features" from the "View" Menu.

Navigate to [Domain] >> System >> Policies in the left panel.

Right-click "Policies", select "Properties".

Select the "Security" tab.

Select "Advanced".

Select the "Auditing" tab.

- Type - Fail
- Principal - Everyone
- Access - Full Control
- Applies to - This object and all descendant objects or Descendant groupPolicyContainer objects

The three Success types listed below are defaults inherited from the Parent Object. Where Special is listed in the summary screens for Access, detailed Permissions are provided for reference.

- Type - Success
- Principal - Everyone
- Access - Special (Permissions: Write all properties, Modify permissions; Properties: all "Write" type selected)
- Inherited from - Parent Object
- Applies to - Descendant groupPolicyContainer objects

Two instances with the following summary information will be listed:

- Type - Success
- Principal - Everyone
- Access - blank (Permissions: none selected; Properties: one instance - Write gPLink, one instance - Write gPOptions)
- Inherited from - Parent Object
- Applies to - Descendant Organization Unit Objects

Description:

Windows Server 2022 Active Directory Domain object must be configured with proper audit settings.

GROUP ID: V-254402 RULE ID: SV-254402r958732

Rationale:

When inappropriate audit settings are configured for directory service database objects, it may be possible for a user or process to update the data without generating any tracking data. The impact of missing audit data is related to the type of object. A failure to capture audit data for objects used by identification, authentication, or authorization functions could degrade or eliminate the ability to track changes to access policy for systems or data.

For Active Directory (AD), there are a number of critical object types in the domain naming context of the AD database for which auditing is essential. This includes the Domain object. Because changes to these objects can significantly impact access controls or the availability of systems, the absence of auditing data makes it impossible to identify the source of changes that impact the confidentiality, integrity, and availability of data and systems throughout an AD domain. The lack of proper auditing can result in insufficient forensic evidence needed to investigate an incident and prosecute the intruder.

Satisfies: SRG-OS-000327-GPOS-00127, SRG-OS-000458-GPOS-00203, SRG-OS-000463-GPOS-00207, SRG-OS-000468-GPOS-00212

Audit:

This applies to domain controllers. It is NA for other systems.

Review the auditing configuration for the Domain object.

Open "Active Directory Users and Computers" (available from various menus or run "dsa.msc").

Ensure "Advanced Features" is selected in the "View" menu.

Select the domain being reviewed in the left pane.

Right-click the domain name and select "Properties".

Select the "Security" tab.

Select "Advanced" and then the "Auditing" tab.

If the audit settings on the Domain object are not at least as inclusive as those below, this is a finding:

- Type - Fail
- Principal - Everyone
- Access - Full Control
- Inherited from - None
- Applies to - This object only

The success types listed below are defaults. Where Special is listed in the summary screens for Access, detailed Permissions are provided for reference. Various Properties selections may also exist by default.

Two instances with the following summary information will be listed:

Type - Success
Principal - Everyone
Access - (blank)
Inherited from - None
Applies to - Special
Type - Success
Principal - Domain Users
Access - All extended rights
Inherited from - None
Applies to - This object only
Type - Success
Principal - Administrators
Access - All extended rights
Inherited from - None
Applies to - This object only
Type - Success
Principal - Everyone
Access - Special
Inherited from - None
Applies to - This object only
(Access - Special = Permissions: Write all properties, Modify permissions,
Modify owner)

Remediation:

Open "Active Directory Users and Computers" (available from various menus or run "dsa.msc").

Ensure "Advanced Features" is selected in the "View" menu.

Select the domain being reviewed in the left pane.

Right-click the domain name and select "Properties".

Select the "Security" tab.

Select "Advanced" and then the "Auditing" tab.

Configure the audit settings for Domain object to include the following:

- Type - Fail
- Principal - Everyone
- Access - Full Control
- Inherited from - None
- Applies to - This object only

The success types listed below are defaults. Where Special is listed in the summary screens for Access, detailed Permissions are provided for reference. Various Properties selections may also exist by default.

Two instances with the following summary information will be listed:

```

Profile Applicability:

- DC SEVERITY: CAT II

Description:

Windows Server 2022 Active Directory Infrastructure object must be configured with proper audit settings.

GROUP ID: V-254403 RULE ID: SV-254403r958732

Rationale:

When inappropriate audit settings are configured for directory service database objects, it may be possible for a user or process to update the data without generating any tracking data. The impact of missing audit data is related to the type of object. A failure to capture audit data for objects used by identification, authentication, or authorization functions could degrade or eliminate the ability to track changes to access policy for systems or data.

For Active Directory (AD), there are a number of critical object types in the domain naming context of the AD database for which auditing is essential. This includes the Infrastructure object. Because changes to these objects can significantly impact access controls or the availability of systems, the absence of auditing data makes it impossible to identify the source of changes that impact the confidentiality, integrity, and availability of data and systems throughout an AD domain. The lack of proper auditing can result in insufficient forensic evidence needed to investigate an incident and prosecute the intruder.

Satisfies: SRG-OS-000327-GPOS-00127, SRG-OS-000458-GPOS-00203, SRG-OS-000463-GPOS-00207, SRG-OS-000468-GPOS-00212

Audit:

This applies to domain controllers. It is NA for other systems.

Review the auditing configuration for Infrastructure object.

Open "Active Directory Users and Computers" (available from various menus or run "dsa.msc").

Ensure "Advanced Features" is selected in the "View" menu.

Select the domain being reviewed in the left pane.

Right-click the "Infrastructure" object in the right pane and select "Properties".

Select the "Security" tab.

Select "Advanced" and then the "Auditing" tab.

If the audit settings on the Infrastructure object are not at least as inclusive as those below, this is a finding:

- Type - Fail
- Principal - Everyone
- Access - Full Control
- Inherited from - None

The success types listed below are defaults. Where Special is listed in the summary screens for Access, detailed Permissions are provided for reference. Various Properties selections may also exist by default.

- Type - Success
- Principal - Everyone
- Access - Special
- Inherited from - None
- (Access - Special = Permissions: Write all properties, All extended rights, Change infrastructure master)

Two instances with the following summary information will be listed:

- Type - Success
- Principal - Everyone
- Access - (blank)
- Inherited from - (CN of domain)

Remediation:

Open "Active Directory Users and Computers" (available from various menus or run "dsa.msc").

Ensure "Advanced Features" is selected in the "View" menu.

Select the domain being reviewed in the left pane.

Right-click the "Infrastructure" object in the right pane and select "Properties".

Select the "Security" tab.

Select "Advanced" and then the "Auditing" tab.

Configure the audit settings for Infrastructure object to include the following:

- Type - Fail
- Principal - Everyone
- Access - Full Control
- Inherited from - None

The success types listed below are defaults. Where Special is listed in the summary screens for Access, detailed Permissions are provided for reference. Various Properties selections may also exist by default.

- Type - Success
- Principal - Everyone
- Access - Special
- Inherited from - None
- (Access - Special = Permissions: Write all properties, All extended rights, Change infrastructure master)

Two instances with the following summary information will be listed:

- Type - Success
- Principal - Everyone
- Access - (blank)
- Inherited from - (CN of domain)

Additional Information:

Description:

Windows Server 2022 Active Directory Domain Controllers Organizational Unit (OU) object must be configured with proper audit settings.

GROUP ID: V-254404 RULE ID: SV-254404r958732

Rationale:

When inappropriate audit settings are configured for directory service database objects, it may be possible for a user or process to update the data without generating any tracking data. The impact of missing audit data is related to the type of object. A failure to capture audit data for objects used by identification, authentication, or authorization functions could degrade or eliminate the ability to track changes to access policy for systems or data.

For Active Directory (AD), there are a number of critical object types in the domain naming context of the AD database for which auditing is essential. This includes the Domain Controller OU object. Because changes to these objects can significantly impact access controls or the availability of systems, the absence of auditing data makes it impossible to identify the source of changes that impact the confidentiality, integrity, and availability of data and systems throughout an AD domain. The lack of proper auditing can result in insufficient forensic evidence needed to investigate an incident and prosecute the intruder.

Satisfies: SRG-OS-000327-GPOS-00127, SRG-OS-000458-GPOS-00203, SRG-OS-000463-GPOS-00207, SRG-OS-000468-GPOS-00212

Audit:

This applies to domain controllers. It is NA for other systems.

Review the auditing configuration for the Domain Controller OU object.

Open "Active Directory Users and Computers" (available from various menus or run "dsa.msc").

Ensure "Advanced Features" is selected in the "View" menu.

Select the "Domain Controllers OU" under the domain being reviewed in the left pane.

Right-click the "Domain Controllers OU" object and select "Properties".

Select the "Security" tab.

Select "Advanced" and then the "Auditing" tab.

If the audit settings on the Domain Controllers OU object are not at least as inclusive as those below, this is a finding:

- Type - Fail
- Principal - Everyone
- Access - Full Control
- Inherited from - None
- Applies to - This object and all descendant objects

The success types listed below are defaults. Where Special is listed in the summary screens for Access, detailed Permissions are provided for reference. Various Properties selections may also exist by default.

```
Type - Success
Principal - Everyone
Access - Special
Inherited from - None
Applies to - This object only
(Access - Special = Permissions: all create, delete and modify permissions)
Type - Success
Principal - Everyone
Access - Write all properties
Inherited from - None
Applies to - This object and all descendant objects
```

Two instances with the following summary information will be listed:

- Type - Success
- Principal - Everyone
- Access - (blank)
- Inherited from - (CN of domain)
- Applies to - Descendant Organizational Unit objects

Remediation:

Open "Active Directory Users and Computers" (available from various menus or run "dsa.msc").

Ensure "Advanced Features" is selected in the "View" menu.

Select the "Domain Controllers OU" under the domain being reviewed in the left pane.

Right-click the "Domain Controllers OU" object and select "Properties".

Select the "Security" tab.

Select "Advanced" and then the "Auditing" tab.

Configure the audit settings for Domain Controllers OU object to include the following:

- Type - Fail
- Principal - Everyone
- Access - Full Control
- Inherited from - None

The success types listed below are defaults. Where Special is listed in the summary screens for Access, detailed Permissions are provided for reference. Various Properties selections may also exist by default.

```
Type - Success
Principal - Everyone
Access - Special
Inherited from - None
Applies to - This object only
(Access - Special = Permissions: all create, delete and modify permissions)
Type - Success
Principal - Everyone
Access - Write all properties
Inherited from - None

GROUP ID: V-254412 RULE ID: SV-254412r958448

Rationale:

Domain controllers are part of the chain of trust for PKI authentications. Without the appropriate certificate, the authenticity of the domain controller cannot be verified. Domain controllers must have a server certificate to establish authenticity as part of PKI authentications in the domain.

Audit:

This applies to domain controllers. It is NA for other systems.

Run "MMC".

Select "Add/Remove Snap-in" from the "File" menu.

Select "Certificates" in the left pane and click "Add >".

Select "Computer Account" and click "Next".

Select the appropriate option for "Select the computer you want this snap-in to manage" and click "Finish".

Click "OK".

Select and expand the Certificates (Local Computer) entry in the left pane.

Select and expand the Personal entry in the left pane.

Select the Certificates entry in the left pane.

If no certificate for the domain controller exists in the right pane, this is a finding.

Remediation:

Obtain a server certificate for the domain controller.

Additional Information:

CCI-000185

For public key-based authentication, validate certificates by constructing and verifying a certification path to an accepted trust anchor including checking certificate status information.

- NIST SP 800-53A :: IA-5 (2).1

1.174 WN22-DC-000290 (Manual)

Profile Applicability:

- DC SEVERITY: CAT I

Description:

Windows Server 2022 domain Controller PKI certificates must be issued by the DoD PKI or an approved External Certificate Authority (ECA).

GROUP ID: V-254413 RULE ID: SV-254413r958448

Rationale:

A PKI implementation depends on the practices established by the Certificate Authority (CA) to ensure the implementation is secure. Without proper practices, the certificates issued by a CA have limited value in authentication functions. The use of multiple CAs from separate PKI implementations results in interoperability issues. If servers and clients do not have a common set of root CA certificates, they are not able to authenticate each other.

Audit:

This applies to domain controllers. It is NA for other systems.

Run "MMC".

Select "Add/Remove Snap-in" from the "File" menu.

Select "Certificates" in the left pane and click "Add >".

Select "Computer Account" and click "Next".

Select the appropriate option for "Select the computer you want this snap-in to manage" and click "Finish".

Click "OK".

Select and expand the Certificates (Local Computer) entry in the left pane.

Select and expand the Personal entry in the left pane.

Select the Certificates entry in the left pane.

In the right pane, examine the "Issued By" field for the certificate to determine the issuing CA.

If the "Issued By" field of the PKI certificate being used by the domain controller does not indicate the issuing CA is part of the DoD PKI or an approved ECA, this is a finding.

If the certificates in use are issued by a CA authorized by the Component's CIO, this is a CAT II finding.

There are multiple sources from which lists of valid DoD CAs and approved ECAs can be obtained:

The Global Directory Service (GDS) website provides an online source. The address for this site is <https://crl.gds.disa.mil>.

DoD Public Key Enablement (PKE) Engineering Support maintains the InstallRoot utility to manage DoD supported root certificates on Windows computers, which includes a list of authorized CAs. The utility package can be downloaded from the PKI and PKE Tools page on Cyber Exchange:

<https://https://cyber.mil/pki-pke/>

Remediation:

Obtain a server certificate for the domain controller issued by the DoD PKI or an approved ECA.

Additional Information:

CCI-000185

For public key-based authentication, validate certificates by constructing and verifying a certification path to an accepted trust anchor including checking certificate status information.

- NIST SP 800-53 :: IA-5 (2)
- NIST SP 800-53 Revision 4 :: IA-5 (2) (a)
- NIST SP 800-53 Revision 5 :: IA-5 (2) (b) (1)
- NIST SP 800-53A :: IA-5 (2).1

1.175 WN22-DC-000300 (Manual)

Profile Applicability:

- DC SEVERITY: CAT I

Description:

Windows Server 2022 PKI certificates associated with user accounts must be issued by a DoD PKI or an approved External Certificate Authority (ECA).

```
GROUP ID: V-254414
RULE ID: SV-254414r958448
```

Rationale:

A PKI implementation depends on the practices established by the Certificate Authority (CA) to ensure the implementation is secure. Without proper practices, the certificates issued by a CA have limited value in authentication functions.

Satisfies: SRG-OS-000066-GPOS-00034, SRG-OS-000403-GPOS-00182

Audit:

This applies to domain controllers. It is NA for other systems.

Review user account mappings to PKI certificates.

Open "Windows PowerShell".

Enter

```
"Get-ADUser -Filter * | FT Name, UserPrincipalName, Enabled"
```

Exclude disabled accounts (e.g., DefaultAccount, Guest) and the krbtgt account.

If the User Principal Name (UPN) is not in the format of an individual's identifier for the certificate type and for the appropriate domain suffix, this is a finding.

For standard NIPRNet certificates, the individual's identifier is in the format of an Electronic Data Interchange - Personnel Identifier (EDI-PI).

Alt Tokens and other certificates may use a different UPN format than the EDI-PI which vary by organization. Verified these with the organization.

NIPRNet Example:

```
Name - User Principal Name
User1 - 1234567890@mil
```

See PKE documentation for other network domain suffixes.

If the mappings are to certificates issued by a CA authorized by the Component's CIO, this is a CAT II finding.

Remediation:

Map user accounts to PKI certificates using the appropriate User Principal Name (UPN) for the network. See PKE documentation for details.

Additional Information:

CCI-000185

For public key-based authentication, validate certificates by constructing and verifying a certification path to an accepted trust anchor including checking certificate status information.

- NIST SP 800-53 :: IA-5 (2)
- NIST SP 800-53 Revision 4 :: IA-5 (2) (a)

- NIST SP 800-53A :: IA-5 (2).1

1.176 WN22-DC-000310 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II

Description:

Windows Server 2022 Active Directory user accounts, including administrators, must be configured to require the use of a Common Access Card (CAC), Personal Identity Verification (PIV)-compliant hardware token, or Alternate Logon Token (ALT) for user authentication.

GROUP ID: V-254415 RULE ID: SV-254415r1081074
--

Rationale:

Smart cards such as the CAC support a two-factor authentication technique. This provides a higher level of trust in the asserted identity than use of the username and password for authentication.

Satisfies: SRG-OS-000105-GPOS-00052, SRG-OS-000106-GPOS-00053, SRG-OS-000107-GPOS-00054, SRG-OS-000108-GPOS-00055, SRG-OS-000375-GPOS-00160

Audit:

This applies to domain controllers. It is NA for other systems.

Open "PowerShell".

Enter the following:

```
"Get-ADUser -Filter {(Enabled -eq $True) -and (SmartcardLogonRequired -eq $False)} | FT Name"
```

("DistinguishedName" may be substituted for "Name" for more detailed output.)

If any user accounts, including administrators, are listed, this is a finding.

Alternately:

To view sample accounts in "Active Directory Users and Computers" (available from various menus or run "dsa.msc"):

Select the Organizational Unit (OU) where the user accounts are located. (By default, this is the Users node; however, accounts may be under other organization-defined OUs.)

Right-click the sample user account and select "Properties".

Select the "Account" tab.

If any user accounts, including administrators, do not have "Smart card is required for interactive logon" checked in the "Account Options" area, this is a finding.

Remediation:

Configure all user accounts, including administrator accounts, in Active Directory to enable the option "Smart card is required for interactive logon".

Run "Active Directory Users and Computers" (available from various menus or run "dsa.msc"):

Select the OU where the user accounts are located. (By default this is the Users node; however, accounts may be under other organization-defined OUs.)

Right-click the user account and select "Properties".

Select the "Account" tab.

Check "Smart card is required for interactive logon" in the "Account Options" area.

1.177 WN22-DC-000320 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II

Description:

Windows Server 2022 domain controllers must require LDAP access signing.

```
GROUP ID: V-254416  
RULE ID: SV-254416r958908
```

Rationale:

Unsigned network traffic is susceptible to man-in-the-middle attacks, where an intruder captures packets between the server and the client and modifies them before forwarding them to the client. In the case of an LDAP server, this means that an attacker could cause a client to make decisions based on false records from the LDAP directory. The risk of an attacker pulling this off can be decreased by implementing strong physical security measures to protect the network infrastructure. Furthermore, implementing Internet Protocol security (IPsec) authentication header mode (AH), which performs mutual authentication and packet integrity for Internet Protocol (IP) traffic, can make all types of man-in-the-middle attacks extremely difficult.

Satisfies: SRG-OS-000423-GPOS-00187, SRG-OS-000424-GPOS-00188

Audit:

This applies to domain controllers. It is NA for other systems.

If the following registry value does not exist or is not configured as specified, this is a finding:

1.179 WN22-DC-000340 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II

Description:

Windows Server 2022 Access this computer from the network user right must only be assigned to the Administrators, Authenticated Users, and Enterprise Domain Controllers groups on domain controllers.

GROUP ID: V-254418 RULE ID: SV-254418r958472

Rationale:

Inappropriate granting of user rights can provide system, administrative, and other high-level capabilities.

Accounts with the "Access this computer from the network" right may access resources on the system, and this right must be limited to those requiring it.

Audit:

This applies to domain controllers. It is NA for other systems.

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to Local

Computer Policy >> Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> User Rights Assignment

If any accounts or groups other than the following are granted the "Access this computer from the network" right, this is a finding.

- Administrators
- Authenticated Users
- Enterprise Domain Controllers

For server core installations, run the following command:

```
Secedit /Export /Areas User_Rights /cfg c:\path\filename.txt
```

Review the text file.

If any SIDs other than the following are granted the "SeNetworkLogonRight" user right, this is a finding.

- S-1-5-32-544 (Administrators)
- S-1-5-11 (Authenticated Users)
- S-1-5-9 (Enterprise Domain Controllers)

If an application requires this user right, this would not be a finding.

Vendor documentation must support the requirement for having the user right.

The requirement must be documented with the Information System Security Officer (ISSO).

The application account must meet requirements for application account passwords, such as length (WN22-00-000050) and required frequency of changes (WN22-00-000060).

Remediation:

Configure the policy value for Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> User Rights Assignment >> Access this computer from the network to include only the following accounts or groups:

- Administrators
- Authenticated Users
- Enterprise Domain Controllers

1.187 WN22-DC-000406 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II

Description:

Windows Server 2022 must be configured for name-based strong mappings for certificates.

GROUP ID: V-271427
RULE ID: SV-271427r1059560

Rationale:

Weak mappings give rise to security vulnerabilities and demand hardening measures. Certificate names must be correctly mapped to the intended user account in Active Directory. A lack of strong name-based mappings allows certain weak certificate mappings, such as Issuer/Subject AltSecID and User Principal Names (UPN) mappings, to be treated as strong mappings.

Audit:

This applies to domain controllers. This is not applicable for member servers.

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

Local Computer Policy >> Computer Configuration >> Administrative Template >> System >> KDC >> Allow name-based strong mappings for certificates

If "Allow name-based strong mappings for certificates" is not "Enabled", this is a finding.

Remediation:

Configure the policy value for

Computer Configuration >> Administrative Template >> System >> KDC >> Allow name-based strong mappings for certificates to "Enabled"

Additional Information:

CCI-000213

Enforce approved authorizations for logical access to information and system resources in accordance with applicable access control policies.

- NIST SP 800-53 :: AC-3
- NIST SP 800-53 Revision 4 :: AC-3
- NIST SP 800-53 Revision 5 :: AC-3
- NIST SP 800-53A :: AC-3.1

1.188 WN22-DC-000410 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II

Description:

Windows Server 2022 Deny log on through Remote Desktop Services user right on domain controllers must be configured to prevent unauthenticated access.

GROUP ID: V-254425
RULE ID: SV-254425r958672

Rationale:

Inappropriate granting of user rights can provide system, administrative, and other high-level capabilities.

The "Deny log on through Remote Desktop Services" user right defines the accounts that are prevented from logging on using Remote Desktop Services.

The Guests group must be assigned this right to prevent unauthenticated access.

Audit:

This applies to domain controllers. A separate version applies to other systems.

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

Local Computer Policy >> Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> User Rights Assignment

If the following accounts or groups are not defined for the "Deny log on through Remote Desktop Services" user right, this is a finding:

- Guests Group

For server core installations, run the following command:

```
Secedit /Export /Areas User_Rights /cfg c:\path\filename.txt
```

Review the text file.

If the following SID(s) are not defined for the "SeDenyRemoteInteractiveLogonRight" user right, this is a finding.

- S-1-5-32-546 (Guests)

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> User Rights Assignment >> Deny log on through Remote Desktop Services

to include the following:

- Guests Group

References:

1. CIS Recommendation: Deny log on through Remote Desktop Services
2. GRID: MS-00000032

Additional Information:

CCI-002314

Employ automated mechanisms to control remote access methods.

- NIST SP 800-53 Revision 5 :: AC-17 (1)

1.189 WN22-DC-000420 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II

Description:

Windows Server 2022 Enable computer and user accounts to be trusted for delegation user right must only be assigned to the Administrators group on domain controllers.

GROUP ID: V-254426
RULE ID: SV-254426r958726

Rationale:

Inappropriate granting of user rights can provide system, administrative, and other high-level capabilities.

The "Enable computer and user accounts to be trusted for delegation" user right allows the "Trusted for Delegation" setting to be changed. This could allow unauthorized users to impersonate other users.

Audit:

This applies to domain controllers. A separate version applies to other systems.

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

Local Computer Policy >> Computer Configuration >> Windows Settings >>
Security Settings >> Local Policies >> User Rights Assignment

If any accounts or groups other than the following are granted the "Enable computer and user accounts to be trusted for delegation" user right, this is a finding.

- Administrators

For server core installations, run the following command:

```
Secedit /Export /Areas User_Rights /cfg c:\path\filename.txt
```

Review the text file.

If any SIDs other than the following are granted the "SeEnableDelegationPrivilege" user right, this is a finding.

- S-1-5-32-544 (Administrators)

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> User Rights Assignment >> Enable computer and user accounts to be trusted for delegation

to include only the following accounts or groups:

- Administrators

References:

1. CIS Recommendation: Enable computer and user accounts to be trusted for delegation
2. GRID: MS-00000033

Additional Information:

CCI-002235

Prevent non-privileged users from executing privileged functions.

- NIST SP 800-53 Revision 5 :: AC-6 (10)

1.190 WN22-DC-000430 (Manual)

Profile Applicability:

- DC SEVERITY: CAT II

Description:

The password for the krbtgt account on a domain must be reset at least every 180 days.

```
GROUP ID: V-254427
RULE ID: SV-254427r991589
```

Rationale:

The krbtgt account acts as a service account for the Kerberos Key Distribution Center (KDC) service. The account and password are created when a domain is created and the password is typically not changed. If the krbtgt account is compromised, attackers can create valid Kerberos Ticket Granting Tickets (TGT).

The password must be changed twice to effectively remove the password history. Changing once, waiting for replication to complete and the amount of time equal to or greater than the maximum Kerberos ticket lifetime, and changing again reduces the risk of issues.

Audit:

This requirement is applicable to domain controllers; it is NA for other systems.

Open "Windows PowerShell".

Enter

```
"Get-ADUser krbtgt -Property PasswordLastSet"
```

If the "PasswordLastSet" date is more than 180 days old, this is a finding.

Remediation:

Reset the password for the krbtgt account at least every 180 days. The password must be changed twice to effectively remove the password history. Changing once, waiting for replication to complete and changing again reduces the risk of issues. Changing twice in rapid succession forces clients to re-authenticate (including application services) but is desired if a compromise is suspected.

PowerShell scripts are available to accomplish this such as at the following link:

<https://gallery.technet.microsoft.com/Reset-the-krbtgt-account-581a9e51>

Open "Active Directory Users and Computers" (available from various menus or run "dsa.msc").

Select "Advanced Features" in the "View" menu if not previously selected.

Select the "Users" node.

Right-click on the krbtgt account and select "Reset password".

Enter a password that meets password complexity requirements.

Clear the "User must change password at next logon" check box.

The system will automatically change this to a system-generated complex password.

Additional Information:

CCI-000366

Implement the security configuration settings.

- NIST SP 800-53 :: CM-6 b

- NIST SP 800-53 Revision 5 :: CM-6 b
- NIST SP 800-53A :: CM-6.1 (iv)

1.191 WN22-MS-000010 (Manual)

Profile Applicability:

- MS SEVERITY: CAT I

Description:

Windows Server 2022 must only allow administrators responsible for the member server or standalone or nondomain-joined system to have Administrator rights on the system.

GROUP ID: V-254428 RULE ID: SV-254428r958726

Rationale:

An account that does not have Administrator duties must not have Administrator rights. Such rights would allow the account to bypass or modify required security restrictions on that machine and make it vulnerable to attack.

System administrators must log on to systems using only accounts with the minimum level of authority necessary.

For domain-joined member servers, the Domain Admins group must be replaced by a domain member server administrator group (see V-243468 in the Active Directory Domain STIG). Restricting highly privileged accounts from the local Administrators group helps mitigate the risk of privilege escalation resulting from credential theft attacks.

Standard user accounts must not be members of the built-in Administrators group.

Audit:

This applies to member servers and standalone or nondomain-joined systems. A separate version applies to domain controllers.

Open "Computer Management".

Navigate to "Groups" under "Local Users and Groups".

Review the local "Administrators" group.

Only administrator groups or accounts responsible for administration of the system may be members of the group.

For domain-joined member servers, the Domain Admins group must be replaced by a domain member server administrator group.

Standard user accounts must not be members of the local Administrator group.

If accounts that do not have responsibility for administration of the system are members of the local Administrators group, this is a finding.

If the built-in Administrator account or other required administrative accounts are found on the system, this is not a finding.

Remediation:

Configure the local "Administrators" group to include only administrator groups or accounts responsible for administration of the system.

For domain-joined member servers, replace the Domain Admins group with a domain member server administrator group.

Remove any standard user accounts.

Additional Information:

CCI-002235

Prevent non-privileged users from executing privileged functions.

- NIST SP 800-53 Revision 4 :: AC-6 (10)
- NIST SP 800-53 Revision 5 :: AC-6 (10)

1.192 WN22-MS-000020 (Automated)

Profile Applicability:

- MS SEVERITY: CAT II

Description:

Windows Server 2022 local administrator accounts must have their privileged token filtered to prevent elevated privileges from being used over the network on domain-joined member servers.

```
GROUP ID: V-254429
RULE ID: SV-254429r958518
```

Rationale:

A compromised local administrator account can provide means for an attacker to move laterally between domain systems.

With User Account Control enabled, filtering the privileged token for local administrator accounts will prevent the elevated privileges of these accounts from being used over the network.

Audit:

This applies to member servers. For domain controllers and standalone or nondomain-joined systems, this is NA.

If the following registry value does not exist or is not configured as specified, this is a finding:

```
Registry Hive:  HKEY_LOCAL_MACHINE
Registry Path:  \SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System

Value Name:  LocalAccountTokenFilterPolicy

Type:  REG_DWORD
Value: 0x00000000 (0)
```

This setting may cause issues with some network scanning tools if local administrative accounts are used remotely. Scans must use domain accounts where possible. If a local administrative account must be used, temporarily enabling the privileged token by configuring the registry value to "1" may be required.

Remediation:

Configure the policy value for

Computer Configuration >> Administrative Templates >> MS Security Guide >>
Apply UAC restrictions to local accounts on network logons to "Enabled"

This policy setting requires the installation of the SecGuide custom templates included with the STIG package. "SecGuide.admx" and "SecGuide.adml" must be copied to the \Windows\PolicyDefinitions and \Windows\PolicyDefinitions\en-US directories respectively.

References:

1. CIS Recommendation: Apply UAC restrictions to local accounts on network logons
2. GRID: MS-00000240

Additional Information:

1.193 WN22-MS-000030 (Automated)

Profile Applicability:

- MS SEVERITY: CAT II

Description:

Windows Server 2022 local users on domain-joined member servers must not be enumerated.

GROUP ID: V-254430
RULE ID: SV-254430r958478

Rationale:

The username is one part of logon credentials that could be used to gain access to a system. Preventing the enumeration of users limits this information to authorized personnel.

Audit:

This applies to member servers. For domain controllers and standalone or nondomain-joined systems, this is NA.

If the following registry value does not exist or is not configured as specified, this is a finding:

Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SOFTWARE\Policies\Microsoft\Windows\System\

Value Name: EnumerateLocalUsers

Type: REG_DWORD
Value: 0x00000000 (0)

Remediation:

Configure the policy value for

Computer Configuration >> Administrative Templates >> System >> Logon >>
Enumerate local users on domain-joined computers to "Disabled"

References:

1. CIS Recommendation: Enumerate local users on domain-joined computers
2. GRID: MS-00000348

Additional Information:

CCI-000381

Configure the system to provide only organization-defined mission essential capabilities.

1.195 WN22-MS-000050 (Automated)

Profile Applicability:

- MS SEVERITY: CAT II

Description:

Windows Server 2022 must limit the caching of logon credentials to four or less on domain-joined member servers.

GROUP ID: V-254432
RULE ID: SV-254432r991589

Rationale:

The default Windows configuration caches the last logon credentials for users who log on interactively to a system. This feature is provided for system availability reasons, such as the user's machine being disconnected from the network or domain controllers being unavailable. Even though the credential cache is well protected, if a system is attacked, an unauthorized individual may isolate the password to a domain user account using a password-cracking program and gain access to the domain.

Audit:

This applies to member servers. For domain controllers and standalone or nondomain-joined systems, this is NA.

If the following registry value does not exist or is not configured as specified, this is a finding:

Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SOFTWARE\Microsoft\Windows NT\CurrentVersion\Winlogon\

Value Name: CachedLogonsCount

Value Type: REG_SZ
Value: 4 (or less)

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> Security Options >> Interactive Logon: Number of previous logons to cache (in case Domain Controller is not available) to "4" logons or less

References:

1. CIS Recommendation: Interactive Logon: Number of previous logons to cache (in case Domain Controller is not available)
2. GRID: MS-00000077

Additional Information:

CCI-000366

Implement the security configuration settings.

- NIST SP 800-53 :: CM-6 b
- NIST SP 800-53 Revision 4 :: CM-6 b

1.196 WN22-MS-000060 (Automated)

Profile Applicability:

- MS SEVERITY: CAT II

Description:

Windows Server 2022 must restrict remote calls to the Security Account Manager (SAM) to Administrators on domain-joined member servers and standalone or nondomain-joined systems.

GROUP ID: V-254433
RULE ID: SV-254433r958726

Rationale:

The Windows SAM stores users' passwords. Restricting Remote Procedure Call (RPC) connections to the SAM to Administrators helps protect those credentials.

Audit:

This applies to member servers and standalone or nondomain-joined systems; it is NA for domain controllers.

If the following registry value does not exist or is not configured as specified, this is a finding:

Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SYSTEM\CurrentControlSet\Control\Lsa\

Value Name: RestrictRemoteSAM

Value Type: REG_SZ
Value: 0:BAG:BAD:(A;;RC;;;BA)

Remediation:

Navigate to the policy

Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> Security Options >> Network access: Restrict clients allowed to make remote calls to SAM

Select "Edit Security" to configure the "Security descriptor:".

Add "Administrators" in "Group or user names:" if it is not already listed (this is the default).

Select "Administrators" in "Group or user names:".

Select "Allow" for "Remote Access" in "Permissions for "Administrators".

Click "OK".

The "Security descriptor:" must be populated with "O:BAG:BAD:(A;;RC;;;BA) for the policy to be enforced.

References:

1. CIS Recommendation: Network access: Restrict clients allowed to make remote calls to SAM
2. GRID: MS-00000100

Additional Information:

CCI-002235

Prevent non-privileged users from executing privileged functions.

- NIST SP 800-53 Revision 4 :: AC-6 (10)
- NIST SP 800-53 Revision 5 :: AC-6 (10)

1.197 WN22-MS-000070 (Automated)

Profile Applicability:

- MS SEVERITY: CAT II

Description:

Windows Server 2022 Access this computer from the network user right must only be assigned to the Administrators and Authenticated Users groups on domain-joined member servers and standalone or nondomain-joined systems.

GROUP ID: V-254434 RULE ID: SV-254434r958472

Rationale:

Inappropriate granting of user rights can provide system, administrative, and other high-level capabilities.

Accounts with the "Access this computer from the network" user right may access resources on the system, and this right must be limited to those requiring it.

Audit:

This applies to member servers and standalone or nondomain-joined systems. A separate version applies to domain controllers.

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>  
Security Settings >> Local Policies >> User Rights Assignment
```

If any accounts or groups other than the following are granted the "Access this computer from the network" user right, this is a finding:

- Administrators
- Authenticated Users

For server core installations, run the following command:

```
Secedit /Export /Areas User_Rights /cfg c:\path\filename.txt
```

Review the text file.

If any SIDs other than the following are granted the "SeNetworkLogonRight" user right, this is a finding:

- S-1-5-32-544 (Administrators)
- S-1-5-11 (Authenticated Users)

If an application requires this user right, this would not be a finding.

Vendor documentation must support the requirement for having the user right.

The requirement must be documented with the Information System Security Officer (ISSO).

The application account must meet requirements for application account passwords, such as length (WN22-00-000050) and required frequency of changes (WN22-00-000060).

Remediation:

Configure the policy value for

```
Computer Configuration >> Windows Settings >> Security Settings >> Local  
Policies >> User Rights Assignment >> Access this computer from the network
```

to include only the following accounts or groups:

- Administrators
- Authenticated Users

References:

1. CIS Recommendation: Access this computer from the network
2. GRID: MS-00000013

Additional Information:

CCI-000213

Enforce approved authorizations for logical access to information and system resources in accordance with applicable access control policies.

- NIST SP 800-53 :: AC-3

- NIST SP 800-53A :: AC-3.1

1.198 WN22-MS-000080 (Manual)

Profile Applicability:

- MS SEVERITY: CAT II

Description:

Windows Server 2022 Deny access to this computer from the network user right on domain-joined member servers must be configured to prevent access from highly privileged domain accounts and local accounts and from unauthenticated access on all systems.

GROUP ID: V-254435 RULE ID: SV-254435r958472

Rationale:

Inappropriate granting of user rights can provide system, administrative, and other high-level capabilities.

The "Deny access to this computer from the network" user right defines the accounts that are prevented from logging on from the network.

In an Active Directory Domain, denying logons to the Enterprise Admins and Domain Admins groups on lower-trust systems helps mitigate the risk of privilege escalation from credential theft attacks, which could lead to the compromise of an entire domain.

Local accounts on domain-joined systems must also be assigned this right to decrease the risk of lateral movement resulting from credential theft attacks.

The Guests group must be assigned this right to prevent unauthenticated access.

Audit:

This applies to member servers and standalone or nondomain-joined systems. A separate version applies to domain controllers.

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>  
Security Settings >> Local Policies >> User Rights Assignment
```

If the following accounts or groups are not defined for the "Deny access to this computer from the network" user right, this is a finding:

Domain Systems Only:

- Enterprise Admins group
- Domain Admins group
- "Local account and member of Administrators group" or "Local account" (see Note below)

All Systems:

- Guests group

For server core installations, run the following command:

```
Secedit /Export /Areas User_Rights /cfg c:\path\filename.txt
```

Review the text file.

If the following SIDs are not defined for the "SeDenyNetworkLogonRight" user right, this is a finding.

Domain Systems Only:

- S-1-5-root domain-519 (Enterprise Admins)
- S-1-5-domain-512 (Domain Admins)
- S-1-5-114 ("Local account and member of Administrators group") or S-1-5-113 ("Local account")

All Systems:

- S-1-5-32-546 (Guests)

Note: These are built-in security groups. "Local account" is more restrictive but may cause issues on servers such as systems that provide failover clustering.

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> User Rights Assignment >> Deny access to this computer from the network

to include the following:

Domain Systems Only:

- Enterprise Admins group
- Domain Admins group
- "Local account and member of Administrators group" or "Local account" (see Note below)

All Systems:

- Guests group

Note: These are built-in security groups. "Local account" is more restrictive but may cause issues on servers such as systems that provide failover clustering.

References:

1. CIS Recommendation: Deny access to this computer from the network

1.200 WN22-MS-000100 (Automated)

Profile Applicability:

- MS SEVERITY: CAT II

Description:

Windows Server 2022 Deny log on as a service user right on domain-joined member servers must be configured to prevent access from highly privileged domain accounts. No other groups or accounts must be assigned this right.

GROUP ID: V-254437 RULE ID: SV-254437r958472

Rationale:

Inappropriate granting of user rights can provide system, administrative, and other high-level capabilities.

The "Deny log on as a service" user right defines accounts that are denied logon as a service.

In an Active Directory Domain, denying logons to the Enterprise Admins and Domain Admins groups on lower-trust systems helps mitigate the risk of privilege escalation from credential theft attacks, which could lead to the compromise of an entire domain.

Incorrect configurations could prevent services from starting and result in a denial of service.

Audit:

This applies to member servers. A separate version applies to domain controllers.

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>  
Security Settings >> Local Policies >> User Rights Assignment
```

If the following accounts or groups are not defined for the "Deny log on as a service" user right on domain-joined systems, this is a finding:

- Enterprise Admins Group
- Domain Admins Group

If any accounts or groups are defined for the "Deny log on as a service" user right on nondomain-joined systems, this is a finding.

For server core installations, run the following command:

```
Secedit /Export /Areas User_Rights /cfg c:\path\filename.txt
```

Review the text file.

If the following SIDs are not defined for the "SeDenyServiceLogonRight" user right on domain-joined systems, this is a finding:

- S-1-5-root domain-519 (Enterprise Admins)
- S-1-5-domain-512 (Domain Admins)

If any SIDs are defined for the user right on nondomain-joined systems, this is a finding.

Remediation:

Configure the policy value for

```
Computer Configuration >> Windows Settings >> Security Settings >> Local  
Policies >> User Rights Assignment >> Deny log on as a service
```

to include the following:

Domain systems:

- Enterprise Admins Group
- Domain Admins Group

References:

1. CIS Recommendation: Deny log on as a service
2. GRID: MS-00000030

Additional Information:

CCI-000213

Enforce approved authorizations for logical access to information and system resources in accordance with applicable access control policies.

1.201 WN22-MS-000110 (Automated)

Profile Applicability:

- MS SEVERITY: CAT II

Description:

Windows Server 2022 Deny log on locally user right on domain-joined member servers must be configured to prevent access from highly privileged domain accounts and from unauthenticated access on all systems.

GROUP ID: V-254438 RULE ID: SV-254438r958472

Rationale:

Inappropriate granting of user rights can provide system, administrative, and other high-level capabilities.

The "Deny log on locally" user right defines accounts that are prevented from logging on interactively.

In an Active Directory Domain, denying logons to the Enterprise Admins and Domain Admins groups on lower-trust systems helps mitigate the risk of privilege escalation from credential theft attacks, which could lead to the compromise of an entire domain.

The Guests group must be assigned this right to prevent unauthenticated access.

Audit:

This applies to member servers and standalone or nondomain-joined systems. A separate version applies to domain controllers.

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>  
Security Settings >> Local Policies >> User Rights Assignment
```

If the following accounts or groups are not defined for the "Deny log on locally" user right, this is a finding:

Domain Systems Only:

- Enterprise Admins Group
- Domain Admins Group

All Systems:

- Guests Group

For server core installations, run the following command:

```
Secedit /Export /Areas User_Rights /cfg c:\path\filename.txt
```

Review the text file.

If the following SIDs are not defined for the "SeDenyInteractiveLogonRight" user right, this is a finding:

Domain Systems Only:

- S-1-5-root domain-519 (Enterprise Admins)
- S-1-5-domain-512 (Domain Admins)

All Systems:

- S-1-5-32-546 (Guests)

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> User Rights Assignment >> Deny log on locally

to include the following:

Domain Systems Only:

- Enterprise Admins Group
- Domain Admins Group

All Systems:

- Guests Group

References:

1. CIS Recommendation: Deny log on locally
2. GRID: MS-00000031

Additional Information:

CCI-000213

Enforce approved authorizations for logical access to information and system resources in accordance with applicable access control policies.

- NIST SP 800-53 :: AC-3

1.202 WN22-MS-000120 (Manual)

Profile Applicability:

- MS SEVERITY: CAT II

Description:

Windows Server 2022 Deny log on through Remote Desktop Services user right on domain-joined member servers must be configured to prevent access from highly privileged domain accounts and all local accounts and from unauthenticated access on all systems.

GROUP ID: V-254439 RULE ID: SV-254439r958672

Rationale:

Inappropriate granting of user rights can provide system, administrative, and other high-level capabilities.

The "Deny log on through Remote Desktop Services" user right defines the accounts that are prevented from logging on using Remote Desktop Services.

In an Active Directory Domain, denying logons to the Enterprise Admins and Domain Admins groups on lower-trust systems helps mitigate the risk of privilege escalation from credential theft attacks, which could lead to the compromise of an entire domain.

Local accounts on domain-joined systems must also be assigned this right to decrease the risk of lateral movement resulting from credential theft attacks.

The Guests group must be assigned this right to prevent unauthenticated access.

Audit:

This applies to member servers and standalone or nondomain-joined systems. A separate version applies to domain controllers.

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>  
Security Settings >> Local Policies >> User Rights Assignment
```

If the following accounts or groups are not defined for the "Deny log on through Remote Desktop Services" user right, this is a finding:

Domain Systems Only:

- Enterprise Admins group
- Domain Admins group
- Local account (see Note below)

All Systems:

- Guests group

For server core installations, run the following command:

```
Secedit /Export /Areas User_Rights /cfg c:\path\filename.txt
```

Review the text file.

If the following SIDs are not defined for the "SeDenyRemoteInteractiveLogonRight" user right, this is a finding.

Domain Systems Only:

- S-1-5-root domain-519 (Enterprise Admins)
- S-1-5-domain-512 (Domain Admins)
- S-1-5-113 ("Local account")

All Systems:

S-1-5-32-546 (Guests)

Note: "Local account" is referring to the Windows built-in security group.

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> User Rights Assignment >> Deny log on through Remote Desktop Services

to include the following:

Domain Systems Only:

- Enterprise Admins group
- Domain Admins group
- Local account (see Note below)

All Systems:

- Guests group

Note: "Local account" is referring to the Windows built-in security group.

References:

1. CIS Recommendation: Deny log on through Remote Desktop Services
2. GRID: MS-00000032

Additional Information:

CCI-002314

Employ automated mechanisms to control remote access methods.

- NIST SP 800-53 Revision 5 :: AC-17 (1)

1.203 WN22-MS-000130 (Automated)

Profile Applicability:

- MS SEVERITY: CAT II

Description:

Windows Server 2022 Enable computer and user accounts to be trusted for delegation user right must not be assigned to any groups or accounts on domain-joined member servers and standalone or nondomain-joined systems.

```
GROUP ID: V-254440  
RULE ID: SV-254440r958726
```

Rationale:

Inappropriate granting of user rights can provide system, administrative, and other high-level capabilities.

The "Enable computer and user accounts to be trusted for delegation" user right allows the "Trusted for Delegation" setting to be changed. This could allow unauthorized users to impersonate other users.

Audit:

This applies to member servers and standalone or nondomain-joined systems. A separate version applies to domain controllers.

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>  
Security Settings >> Local Policies >> User Rights Assignment
```

If any accounts or groups are granted the "Enable computer and user accounts to be trusted for delegation" user right, this is a finding.

For server core installations, run the following command:

```
Secedit /Export /Areas User_Rights /cfg c:\path\filename.txt
```

Review the text file.

If any SIDs are granted the "SeEnableDelegationPrivilege" user right, this is a finding.

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> User Rights Assignment >> Enable computer and user accounts to be trusted for delegation

to be defined but containing no entries (blank).

References:

1. CIS Recommendation: Enable computer and user accounts to be trusted for delegation
2. GRID: MS-00000033

Additional Information:

CCI-002235

Prevent non-privileged users from executing privileged functions.

- NIST SP 800-53 Revision 4 :: AC-6 (10)
- NIST SP 800-53 Revision 5 :: AC-6 (10)

1.204 WN22-MS-000140 (Automated)

Profile Applicability:

- MS SEVERITY: CAT I

Description:

Windows Server 2022 must be running Credential Guard on domain-joined member servers.

GROUP ID: V-254441 RULE ID: SV-254441r991589

Rationale:

Credential Guard uses virtualization-based security to protect data that could be used in credential theft attacks if compromised. This authentication information, which was stored in the Local Security Authority (LSA) in previous versions of Windows, is isolated from the rest of operating system and can only be accessed by privileged system software.

Audit:

For domain controllers and standalone or nondomain-joined systems, this is NA.

Open "PowerShell" with elevated privileges (run as administrator).

Enter the following:

```
"Get-CimInstance -ClassName Win32_DeviceGuard -Namespace  
root\Microsoft\Windows\DeviceGuard"
```

If "SecurityServicesRunning" does not include a value of "1" (e.g., "{1, 2}"), this is a finding.

Alternately:

Run "System Information".

Under "System Summary", verify the following:

If "Device Guard Security Services Running" does not list "Credential Guard", this is a finding.

The policy settings referenced in the Fix section will configure the following registry value. However, due to hardware requirements, the registry value alone does not ensure proper function.

```
Registry Hive: HKEY_LOCAL_MACHINE  
Registry Path: \SOFTWARE\Policies\Microsoft\Windows\DeviceGuard\  
  
Value Name: LsaCfgFlags  
Value Type: REG_DWORD  
Value: 0x00000001 (1) (Enabled with UEFI lock)
```

A Microsoft article on Credential Guard system requirement can be found at the following link:

<https://docs.microsoft.com/en-us/windows/security/identity-protection/credential-guard/credential-guard-requirements>

Remediation:

Configure the policy value for

Computer Configuration >> Administrative Templates >> System >> Device Guard
>> Turn On Virtualization Based Security to "Enabled" with "Enabled with UEFI
lock" selected for "Credential Guard Configuration"

A Microsoft article on Credential Guard system requirement can be found at the following link:

<https://docs.microsoft.com/en-us/windows/security/identity-protection/credential-guard/credential-guard-requirements>

Severity Override Guidance: The AO can allow the severity override if they have reviewed the overall protection provided to the affected servers that are not capable of complying with the Credential Guard requirement. Items that must be reviewed/considered for compliance or mitigation for non-Credential Guard compliance are:

The use of Microsoft Local Administrator Password Solution (LAPS) or similar products to control different local administrative passwords for all affected servers. This is to include a strict password change requirement (60 days or less).

....

Strict separation of roles and duties. Server administrator credentials cannot be used on Windows 10 desktop to administer it. Documentation of all exceptions must be supplied.

....

Use of a Privileged Access Workstation (PAW) and adherence to the Clean Source principle for administering affected servers.

....

Boundary Protection that is currently in place to protect from vulnerabilities in the network/servers.

....

Windows Defender rule block credential stealing from LSASS.exe is applied. This rule can only be applied if Windows Defender is in use.

....

The overall number of vulnerabilities that are unmitigated on the network/servers.

1.205 WN22-PK-000010 (Manual)

Profile Applicability:

- MS SEVERITY: CAT II
- DC SEVERITY: CAT II

Description:

Windows Server 2022 must have the DoD Root Certificate Authority (CA) certificates installed in the Trusted Root Store.

GROUP ID: V-254442 RULE ID: SV-254442r958448

Rationale:

To ensure secure DoD websites and DoD-signed code are properly validated, the system must trust the DoD Root CAs. The DoD root certificates will ensure that the trust chain is established for server certificates issued from the DoD CAs.

Satisfies: SRG-OS-000066-GPOS-00034, SRG-OS-000403-GPOS-00182

Audit:

The certificates and thumbprints referenced below apply to unclassified systems; refer to PKE documentation for other networks.

Open "Windows PowerShell" as an administrator.

Execute the following command:

```
Get-ChildItem -Path Cert:Localmachine\root | Where Subject -Like "*DoD*" | FL  
Subject, Thumbprint, NotAfter
```

If the following certificate "Subject" and "Thumbprint" information is not displayed, this is a finding.

```
Subject: CN=DoD Root CA 3, OU=PKI, OU=DoD, O=U.S. Government, C=US  
Thumbprint: D73CA91102A2204A36459ED32213B467D7CE97FB  
NotAfter: 12/30/2029  
Subject: CN=DoD Root CA 4, OU=PKI, OU=DoD, O=U.S. Government, C=US  
Thumbprint: B8269F25DBD937ECAFD4C35A9838571723F2D026  
NotAfter: 7/25/2032  
Subject: CN=DoD Root CA 5, OU=PKI, OU=DoD, O=U.S. Government, C=US  
Thumbprint: 4ECB5CC3095670454DA1CBD410FC921F46B8564B  
NotAfter: 6/14/2041  
Subject: CN=DoD Root CA 6, OU=PKI, OU=DoD, O=U.S. Government, C=US  
Thumbprint : D37ECF61C0B4ED88681EF3630C4E2FC787B37AEF  
NotAfter: 1/24/2053 11:36:17 AM
```

Alternately, use the Certificates MMC snap-in:

Run "MMC".

Select "File", "Add/Remove Snap-in".

Select "Certificates" and click "Add".

Select "Computer account" and click "Next".

Select "Local computer: (the computer this console is running on)" and click "Finish".

Click "OK".

Expand "Certificates" and navigate to "Trusted Root Certification Authorities >> Certificates".

For each of the DoD Root CA certificates noted below:

Right-click on the certificate and select "Open".

Select the "Details" tab.

Scroll to the bottom and select "Thumbprint".

If the DoD Root CA certificates below are not listed or the value for the "Thumbprint" field is not as noted, this is a finding.

```
DoD Root CA 3
Thumbprint: D73CA91102A2204A36459ED32213B467D7CE97FB
Valid to: Sunday, December 30, 2029
DoD Root CA 4
Thumbprint: B8269F25DBD937ECAFD4C35A9838571723F2D026
Valid to: Sunday, July 25, 2032
DoD Root CA 5
Thumbprint: 4ECB5CC3095670454DA1CBD410FC921F46B8564B
Valid to: Friday, June 14, 2041
DoD Root CA 6
Thumbprint: D37ECF61C0B4ED88681EF3630C4E2FC787B37AEFB
Valid to: Friday, January 24, 2053
```

Remediation:

Install the DoD Root CA certificates:

- DoD Root CA 3
- DoD Root CA 4
- DoD Root CA 5
- DoD Root CA 6

The InstallRoot tool is available on Cyber Exchange at <https://cyber.mil/pki-pke/tools-configuration-files>. Certificate bundles published by the PKI can be found at <https://crl.gds.disa.mil/>.

1.208 WN22-SO-000010 (Automated)

Profile Applicability:

- MS SEVERITY: CAT II
- DC SEVERITY: CAT II

Description:

Windows Server 2022 must have the built-in guest account disabled.

```
GROUP ID: V-254445
RULE ID: SV-254445r958504
```

Rationale:

A system faces an increased vulnerability threat if the built-in guest account is not disabled. This is a known account that exists on all Windows systems and cannot be deleted. This account is initialized during the installation of the operating system with no password assigned.

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>
Security Settings >> Local Policies >> Security Options
```

If the value for "Accounts: Guest account status" is not set to "Disabled", this is a finding.

For server core installations, run the following command:

```
Secedit /Export /Areas SecurityPolicy /CFG C:\Path\FileName.Txt
```

If "EnableGuestAccount" equals "1" in the file, this is a finding.

Remediation:

Configure the policy value for

```
Computer Configuration >> Windows Settings >> Security Settings >> Local
Policies >> Security Options >> Accounts: Guest account status to "Disabled"
` ``.
```

1.209 WN22-SO-000020 (Automated)

Profile Applicability:

- MS SEVERITY: CAT I
- DC SEVERITY: CAT I

Description:

Windows Server 2022 must prevent local accounts with blank passwords from being used from the network.

```
GROUP ID: V-254446
RULE ID: SV-254446r991589
```

Rationale:

An account without a password can allow unauthorized access to a system as only the username would be required. Password policies must prevent accounts with blank passwords from existing on a system. However, if a local account with a blank password does exist, enabling this setting will prevent network access, limiting the account to local console logon only.

Audit:

If the following registry value does not exist or is not configured as specified, this is a finding:

```
Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SYSTEM\CurrentControlSet\Control\Lsa\

Value Name: LimitBlankPasswordUse

Value Type: REG_DWORD
Value: 0x00000001 (1)
```

Remediation:

Configure the policy value for

```
Computer Configuration >> Windows Settings >> Security Settings >> Local
Policies >> Security Options >> Accounts: Limit local account use of blank
passwords to console logon only to "Enabled"
```

References:

1.210 WN22-SO-000030 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 built-in administrator account must be renamed.

```
GROUP ID: V-254447
RULE ID: SV-254447r991589
```

Rationale:

The built-in administrator account is a well-known account subject to attack. Renaming this account to an unidentified name improves the protection of this account and the system.

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>
Security Settings >> Local Policies >> Security Options
```

If the value for "Accounts: Rename administrator account" is not set to a value other than "Administrator", this is a finding.

For server core installations, run the following command:

```
Secedit /Export /Areas SecurityPolicy /CFG C:\Path\FileName.Txt
```

If "NewAdministratorName" is not something other than "Administrator" in the file, this is a finding.

Remediation:

Configure the policy value for

```
Computer Configuration >> Windows Settings >> Security Settings >> Local
Policies >> Security Options >> Accounts: Rename administrator account
```

to a name other than "Administrator".

References:

1. CIS Recommendation: Accounts: Rename administrator account
2. GRID: MS-00000056

1.211 WN22-SO-000040 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 built-in guest account must be renamed.

```
GROUP ID: V-254448
RULE ID: SV-254448r991589
```

Rationale:

The built-in guest account is a well-known user account on all Windows systems and, as initially installed, does not require a password. This can allow access to system resources by unauthorized users. Renaming this account to an unidentified name improves the protection of this account and the system.

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>
Security Settings >> Local Policies >> Security Options
```

If the value for "Accounts: Rename guest account" is not set to a value other than "Guest", this is a finding.

For server core installations, run the following command:

```
Secedit /Export /Areas SecurityPolicy /CFG C:\Path\FileName.Txt
```

If "NewGuestName" is not something other than "Guest" in the file, this is a finding.

Remediation:

Configure the policy value for

```
Computer Configuration >> Windows Settings >> Security Settings >> Local
Policies >> Security Options >> Accounts: Rename guest account
```

to a name other than "Guest".

1.212 WN22-SO-000050 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must force audit policy subcategory settings to override audit policy category settings.

GROUP ID: V-254449
RULE ID: SV-254449r958442

Rationale:

Maintaining an audit trail of system activity logs can help identify configuration errors, troubleshoot service disruptions, and analyze compromises that have occurred, as well as detect attacks. Audit logs are necessary to provide a trail of evidence in case the system or network is compromised. Collecting this data is essential for analyzing the security of information assets and detecting signs of suspicious and unexpected behavior. This setting allows administrators to enable more precise auditing capabilities.

Audit:

If the following registry value does not exist or is not configured as specified, this is a finding:

Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SYSTEM\CurrentControlSet\Control\Lsa\

Value Name: SCENoApplyLegacyAuditPolicy

Value Type: REG_DWORD
Value: 0x00000001 (1)

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> Security Options >> Audit: Force audit policy subcategory settings (Windows Vista or later) to override audit policy category settings to "Enabled"

References:

1. CIS Recommendation: Audit: Force audit policy subcategory settings (Windows Vista or later) to override audit policy category settings
2. GRID: MS-00000058

Additional Information:

1.216 WN22-SO-000090 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 computer account password must not be prevented from being reset.

```
GROUP ID: V-254453
RULE ID: SV-254453r971545
```

Rationale:

Computer account passwords are changed automatically on a regular basis. Disabling automatic password changes can make the system more vulnerable to malicious access. Frequent password changes can be a significant safeguard for the system. A new password for the computer account will be generated every 30 days.

Audit:

If the following registry value does not exist or is not configured as specified, this is a finding:

```
Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SYSTEM\CurrentControlSet\Services\Netlogon\Parameters\

Value Name: DisablePasswordChange

Value Type: REG_DWORD
Value: 0x00000000 (0)
```

Remediation:

Configure the policy value for

```
Computer Configuration >> Windows Settings >> Security Settings >> Local
Policies >> Security Options >> Domain member: Disable machine account
password changes to "Disabled"
```

References:

1. CIS Recommendation: Domain member: Disable machine account password changes
2. GRID: MS-00000067

Additional Information:

CCI-001967

Authenticate organization-defined devices and/or types of devices before establishing a local, remote, and/or network connection using bidirectional authentication that is cryptographically based.

1.217 WN22-SO-000100 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 maximum age for machine account passwords must be configured to 30 days or less.

GROUP ID: V-254454
RULE ID: SV-254454r991589

Rationale:

Computer account passwords are changed automatically on a regular basis. This setting controls the maximum password age that a machine account may have. This must be set to no more than 30 days, ensuring the machine changes its password monthly.

Audit:

This is the default configuration for this setting (30 days).

If the following registry value does not exist or is not configured as specified, this is a finding:

Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SYSTEM\CurrentControlSet\Services\Netlogon\Parameters\

Value Name: MaximumPasswordAge

Value Type: REG_DWORD
Value: 0x0000001e (30) (or less, but not 0)

Remediation:

This is the default configuration for this setting (30 days).

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> Security Options >> Domain member: Maximum machine account password age to "30" or less (excluding "0", which is unacceptable)

References:

1. CIS Recommendation: Domain member: Maximum machine account password age
2. GRID: MS-00000068

Additional Information:

CCI-000366

Implement the security configuration settings.

1.218 WN22-SO-000110 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must be configured to require a strong session key.

GROUP ID: V-254455
RULE ID: SV-254455r958908

Rationale:

A computer connecting to a domain controller will establish a secure channel. The secure channel connection may be subject to compromise, such as hijacking or eavesdropping, if strong session keys are not used to establish the connection. Requiring strong session keys enforces 128-bit encryption between systems.

Satisfies: SRG-OS-000423-GPOS-00187, SRG-OS-000424-GPOS-00188

Audit:

If the following registry value does not exist or is not configured as specified, this is a finding:

Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SYSTEM\CurrentControlSet\Services\Netlogon\Parameters\

Value Name: RequireStrongKey

Value Type: REG_DWORD
Value: 0x00000001 (1)

This setting may prevent a system from being joined to a domain if not configured consistently between systems.

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> Security Options >> Domain member: Require strong (Windows 2000 or Later) session key to "Enabled"

References:

1. CIS Recommendation: Domain member: Require strong (Windows 2000 or later) session key

1.222 WN22-SO-000150 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 Smart Card removal option must be configured to Force Logoff or Lock Workstation.

GROUP ID: V-254459
RULE ID: SV-254459r991589

Rationale:

Unattended systems are susceptible to unauthorized use and must be locked. Configuring a system to lock when a smart card is removed will ensure the system is inaccessible when unattended.

Audit:

If the following registry value does not exist or is not configured as specified, this is a finding:

Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SOFTWARE\Microsoft\Windows NT\CurrentVersion\Winlogon\

Value Name: scremoveoption

Value Type: REG_SZ
Value: 1 (Lock Workstation) or 2 (Force Logoff)

If configuring this on servers causes issues, such as terminating users' remote sessions, and the organization has a policy in place that any other sessions on the servers, such as administrative console logons, are manually locked or logged off when unattended or not in use, this would be acceptable. This must be documented with the Information System Security Officer (ISSO).

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> Security Options >> Interactive logon: Smart card removal behavior to "Lock Workstation" or "Force Logoff"

References:

1. CIS Recommendation: Interactive logon: Smart card removal behavior
2. GRID: MS-00000080

Additional Information:

CCI-000366

Implement the security configuration settings.

1.225 WN22-SO-000180 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 unencrypted passwords must not be sent to third-party Server Message Block (SMB) servers.

GROUP ID: V-254462
RULE ID: SV-254462r987796

Rationale:

Some non-Microsoft SMB servers only support unencrypted (plain-text) password authentication. Sending plain-text passwords across the network when authenticating to an SMB server reduces the overall security of the environment. Check with the vendor of the SMB server to determine if there is a way to support encrypted password authentication.

Audit:

If the following registry value does not exist or is not configured as specified, this is a finding:

Registry Hive: HKEY_LOCAL_MACHINE
Registry Path:
\SYSTEM\CurrentControlSet\Services\LanmanWorkstation\Parameters\

Value Name: EnablePlainTextPassword

Value Type: REG_DWORD
Value: 0x00000000 (0)

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> Security Options >> Microsoft Network Client: Send unencrypted password to third-party SMB servers to "Disabled"

References:

1. CIS Recommendation: Microsoft Network Client: Send unencrypted password to third-party SMB servers
2. GRID: MS-00000083

Additional Information:

CCI-000197

For password-based authentication, transmit passwords only cryptographically-protected channels.

Description:

Windows Server 2022 LAN Manager authentication level must be configured to send NTLMv2 response only and to refuse LM and NTLM.

```
GROUP ID: V-254475  
RULE ID: SV-254475r991589
```

Rationale:

The Kerberos v5 authentication protocol is the default for authentication of users who are logging on to domain accounts. NTLM, which is less secure, is retained in later Windows versions for compatibility with clients and servers that are running earlier versions of Windows or applications that still use it. It is also used to authenticate logons to standalone or nondomain-joined computers that are running later versions.

Audit:

If the following registry value does not exist or is not configured as specified, this is a finding:

```
Registry Hive: HKEY_LOCAL_MACHINE  
Registry Path: \SYSTEM\CurrentControlSet\Control\Lsa\  
  
Value Name: LmCompatibilityLevel  
  
Value Type: REG_DWORD  
Value: 0x00000005 (5)
```

Remediation:

Configure the policy value for

```
Computer Configuration >> Windows Settings >> Security Settings >> Local  
Policies >> Security Options >> Network security: LAN Manager authentication  
level to "Send NTLMv2 response only. Refuse LM & NTLM"
```

References:

1. CIS Recommendation: Network security: LAN Manager authentication level
2. GRID: MS-00000109

1.239 WN22-SO-000320 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must be configured to at least negotiate signing for LDAP client signing.

GROUP ID: V-254476
RULE ID: SV-254476r991589

Rationale:

This setting controls the signing requirements for LDAP clients. This must be set to "Negotiate signing" or "Require signing", depending on the environment and type of LDAP server in use.

Audit:

If the following registry value does not exist or is not configured as specified, this is a finding:

Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SYSTEM\CurrentControlSet\Services\LDAP\

Value Name: LDAPClientIntegrity

Value Type: REG_DWORD
Value: 0x00000001 (1)

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> Security Options >> Network security: LDAP client signing requirements to "Negotiate signing" at a minimum

References:

1. CIS Recommendation: Network security: LDAP client signing requirements
2. GRID: MS-00000110

1.242 WN22-SO-000350 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 users must be required to enter a password to access private keys stored on the computer.

```
GROUP ID:V-254479
RULE ID: SV-254479r958450
```

Rationale:

If the private key is discovered, an attacker can use the key to authenticate as an authorized user and gain access to the network infrastructure.

The cornerstone of the PKI is the private key used to encrypt or digitally sign information.

If the private key is stolen, this will lead to the compromise of the authentication and nonrepudiation gained through PKI because the attacker can use the private key to digitally sign documents and pretend to be the authorized user.

Both the holders of a digital certificate and the issuing authority must protect the computers, storage devices, or whatever they use to keep the private keys.

Audit:

If the following registry value does not exist or is not configured as specified, this is a finding:

```
Registry Hive:  HKEY_LOCAL_MACHINE
Registry Path:  \SOFTWARE\Policies\Microsoft\Cryptography\

Value Name:  ForceKeyProtection

Type:  REG_DWORD
Value:  0x00000002 (2)
```

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> Security Options >> System cryptography: Force strong key protection for user keys stored on the computer to "User must enter a password each time they use a key"

Additional Information:

CCI-000186

For public key-based authentication, enforce authorized access to the corresponding private key.

- NIST SP 800-53 :: IA-5 (2)
- NIST SP 800-53 Revision 4 :: IA-5 (2) (b)

1.243 WN22-SO-000360 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must be configured to use FIPS-compliant algorithms for encryption, hashing, and signing.

GROUP ID: V-254480
RULE ID: SV-254480r1050599

Rationale:

This setting ensures the system uses algorithms that are FIPS-compliant for encryption, hashing, and signing. FIPS-compliant algorithms meet specific standards established by the U.S. Government and must be the algorithms used for all OS encryption functions.

Audit:

This is NA if the host is running SharePoint. If the following registry value does not exist or is not configured as specified, this is a finding:

Registry Hive: HKEY_LOCAL_MACHINE
Registry Path: \SYSTEM\CurrentControlSet\Control\Lsa\FIPSAlgorithmPolicy\

Value Name: Enabled

Value Type: REG_DWORD
Value: 0x00000001 (1)

Clients with this setting enabled will not be able to communicate via digitally encrypted or signed protocols with servers that do not support these algorithms. Both the browser and web server must be configured to use TLS; otherwise the browser will not be able to connect to a secure site.

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> Security Options >> System cryptography: Use FIPS compliant algorithms for encryption, hashing, and signing to "Enabled"

Additional Information:

CCI-002450

Implement organization-defined types of cryptography for each specified cryptography use.

1.244 WN22-SO-000370 (Automated)

Profile Applicability:

- DC SEVERITY: CAT III
- MS SEVERITY: CAT III

Description:

Windows Server 2022 default permissions of global system objects must be strengthened.

```
GROUP ID: V-254481  
RULE ID: SV-254481r991589
```

Rationale:

Windows systems maintain a global list of shared system resources such as DOS device names, mutexes, and semaphores. Each type of object is created with a default Discretionary Access Control List (DACL) that specifies who can access the objects with what permissions. When this policy is enabled, the default DACL is stronger, allowing nonadministrative users to read shared objects but not to modify shared objects they did not create.

Audit:

If the following registry value does not exist or is not configured as specified, this is a finding:

```
Registry Hive: HKEY_LOCAL_MACHINE  
Registry Path: \SYSTEM\CurrentControlSet\Control\Session Manager\  
  
Value Name: ProtectionMode  
  
Value Type: REG_DWORD  
Value: 0x00000001 (1)
```

Remediation:

Configure the policy value for

```
Computer Configuration >> Windows Settings >> Security Settings >> Local  
Policies >> Security Options >> System objects: Strengthen default  
permissions of internal system objects (e.g., Symbolic Links) to "Enabled"
```

References:

1. CIS Recommendation: System objects: Strengthen default permissions of internal system objects (e.g., Symbolic Links)
2. GRID: MS-00000119

1.253 WN22-UC-000010 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 must preserve zone information when saving attachments.

```
GROUP ID: V-254490
RULE ID: SV-254490r991589
```

Rationale:

Attachments from outside sources may contain malicious code. Preserving zone of origin (internet, intranet, local, restricted) information on file attachments allows Windows to determine risk.

Audit:

The default behavior is for Windows to mark file attachments with their zone information.

If the registry Value Name below does not exist, this is not a finding.

If it exists and is configured with a value of "2", this is not a finding.

If it exists and is configured with a value of "1", this is a finding.

```
Registry Hive: HKEY_CURRENT_USER
Registry Path:
\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\Attachments\

Value Name: SaveZoneInformation

Value Type: REG_DWORD
Value: 0x00000002 (2) (or if the Value Name does not exist)
```

Remediation:

The default behavior is for Windows to mark file attachments with their zone information.

If this needs to be corrected, configure the policy value for

```
User Configuration >> Administrative Templates >> Windows Components >> Attachment Manager >> Do not preserve zone information in file attachments to "Not Configured" or "Disabled"
```

References:

1. CIS Recommendation: Do not preserve zone information in file attachments
2. GRID: MS-00000559

1.254 WN22-UR-000010 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 Access Credential Manager as a trusted caller user right must not be assigned to any groups or accounts.

```
GROUP ID: V-254491
RULE ID: SV-254491r958726
```

Rationale:

Inappropriate granting of user rights can provide system, administrative, and other high-level capabilities.

Accounts with the "Access Credential Manager as a trusted caller" user right may be able to retrieve the credentials of other accounts from Credential Manager.

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>
Security Settings >> Local Policies >> User Rights Assignment
```

If any accounts or groups are granted the "Access Credential Manager as a trusted caller" user right, this is a finding.

For server core installations, run the following command:

```
Secedit /Export /Areas User_Rights /cfg c:\path\filename.txt
```

Review the text file.

If any SIDs are granted the "SeTrustedCredManAccessPrivilege" user right, this is a finding.

Remediation:

Configure the policy value for Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> User Rights Assignment >> Access Credential Manager as a trusted caller

to be defined but containing no entries (blank).

References:

1. CIS Recommendation: Access Credential Manager as a trusted caller

Description:

Windows Server 2022 Act as part of the operating system user right must not be assigned to any groups or accounts.

GROUP ID: V-254492 RULE ID: SV-254492r958726

Rationale:

Inappropriate granting of user rights can provide system, administrative, and other high-level capabilities.

Accounts with the "Act as part of the operating system" user right can assume the identity of any user and gain access to resources that the user is authorized to access. Any accounts with this right can take complete control of a system.

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>  
Security Settings >> Local Policies >> User Rights Assignment
```

If any accounts or groups (to include administrators), are granted the "Act as part of the operating system" user right, this is a finding.

For server core installations, run the following command:

```
Secedit /Export /Areas User_Rights /cfg c:\path\filename.txt
```

Review the text file.

If any SIDs are granted the "SeTcbPrivilege" user right, this is a finding.

If an application requires this user right, this would not be a finding.

Vendor documentation must support the requirement for having the user right.

The requirement must be documented with the Information System Security Officer (ISSO).

The application account must meet requirements for application account passwords, such as length (WN22-00-000050) and required frequency of changes (WN22-00-000060).

Passwords for accounts with this user right must be protected as highly privileged accounts.

Remediation:

Configure the policy value for

```
Computer Configuration >> Windows Settings >> Security Settings >> Local  
Policies >> User Rights Assignment >> Act as part of the operating system
```

to be defined but containing no entries (blank).

Description:

Windows Server 2022 Allow log on locally user right must only be assigned to the Administrators group.

GROUP ID: V-254493 RULE ID: SV-254493r958472

Rationale:

Inappropriate granting of user rights can provide system, administrative, and other high-level capabilities.

Accounts with the "Allow log on locally" user right can log on interactively to a system.

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>  
Security Settings >> Local Policies >> User Rights Assignment
```

If any accounts or groups other than the following are granted the "Allow log on locally" user right, this is a finding:

- Administrators

For server core installations, run the following command:

```
Secedit /Export /Areas User_Rights /cfg c:\path\filename.txt
```

Review the text file.

If any SIDs other than the following are granted the "SeInteractiveLogonRight" user right, this is a finding:

- S-1-5-32-544 (Administrators)

If an application requires this user right, this would not be a finding.

Vendor documentation must support the requirement for having the user right.

The requirement must be documented with the Information System Security Officer (ISSO).

The application account must meet requirements for application account passwords, such as length (WN22-00-000050) and required frequency of changes (WN22-00-000060).

CCI-002235

Prevent non-privileged users from executing privileged functions.

- NIST SP 800-53 Revision 4 :: AC-6 (10)
- NIST SP 800-53 Revision 5 :: AC-6 (10)

1.269 WN22-UR-000160 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 lock pages in memory user right must not be assigned to any groups or accounts.

GROUP ID: V-254506 RULE ID: SV-254506r958726

Rationale:

Inappropriate granting of user rights can provide system, administrative, and other high-level capabilities.

The "Lock pages in memory" user right allows physical memory to be assigned to processes, which could cause performance issues or a denial of service.

Satisfies: SRG-OS-000324-GPOS-00125, SRG-OS-000433-GPOS-00193

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>  
Security Settings >> Local Policies >> User Rights Assignment
```

If any accounts or groups are granted the "Lock pages in memory" user right, this is a finding.

For server core installations, run the following command:

```
Secedit /Export /Areas User_Rights /cfg c:\path\filename.txt
```

Review the text file.

If any SIDs are granted the "SeLockMemoryPrivilege" user right, this is a finding.

If an application requires this user right, this would not be a finding.

Vendor documentation must support the requirement for having the user right.

The requirement must be documented with the Information System Security Officer (ISSO).

The application account must meet requirements for application account passwords, such as length (WN22-00-000050) and required frequency of changes (WN22-00-000060).

Remediation:

Configure the policy value for

```
Computer Configuration >> Windows Settings >> Security Settings >> Local  
Policies >> User Rights Assignment >> Lock pages in memory
```

to be defined but containing no entries (blank).

- NIST SP 800-53 Revision 5 :: AC-6 (10)

CCI-002824

Implement organization-defined controls to protect its memory from unauthorized code execution.

- NIST SP 800-53 Revision 4 :: SI-16
- NIST SP 800-53 Revision 5 :: SI-16

1.270 WN22-UR-000170 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 manage auditing and security log user right must only be assigned to the Administrators group.

GROUP ID: V-254507 RULE ID: SV-254507r958434

Rationale:

Inappropriate granting of user rights can provide system, administrative, and other high-level capabilities.

Accounts with the "Manage auditing and security log" user right can manage the security log and change auditing configurations. This could be used to clear evidence of tampering.

Satisfies: SRG-OS-000057-GPOS-00027, SRG-OS-000058-GPOS-00028, SRG-OS-000059-GPOS-00029, SRG-OS-000063-GPOS-00032, SRG-OS-000337-GPOS-00129

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>  
Security Settings >> Local Policies >> User Rights Assignment
```

If any accounts or groups other than the following are granted the "Manage auditing and security log" user right, this is a finding.

- Administrators

For server core installations, run the following command:

```
Secedit /Export /Areas User_Rights /cfg c:\path\filename.txt
```

Review the text file.

If any SIDs other than the following are granted the "SeSecurityPrivilege" user right, this is a finding:

- S-1-5-32-544 (Administrators)

If the organization has an Auditors group, the assignment of this group to the user right would not be a finding.

If an application requires this user right, this would not be a finding.

Vendor documentation must support the requirement for having the user right.

The requirement must be documented with the Information System Security Officer (ISSO).

The application account must meet requirements for application account passwords, such as length (WN22-00-000050) and required frequency of changes (WN22-00-000060).

Remediation:

Configure the policy value for

```
Computer Configuration >> Windows Settings >> Security Settings >> Local  
Policies >> User Rights Assignment >> Manage auditing and security log
```

to include only the following accounts or groups:

- Administrators

References:

1.271 WN22-UR-000180 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 modify firmware environment values user right must only be assigned to the Administrators group.

```
GROUP ID: V-254508  
RULE ID: SV-254508r958726
```

Rationale:

Inappropriate granting of user rights can provide system, administrative, and other high-level capabilities.

Accounts with the "Modify firmware environment values" user right can change hardware configuration environment variables. This could result in hardware failures or a denial of service.

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>  
Security Settings >> Local Policies >> User Rights Assignment
```

If any accounts or groups other than the following are granted the "Modify firmware environment values" user right, this is a finding:

- Administrators

For server core installations, run the following command:

```
Secedit /Export /Areas User_Rights /cfg c:\path\filename.txt
```

Review the text file.

If any SIDs other than the following are granted the "SeSystemEnvironmentPrivilege" user right, this is a finding:

- S-1-5-32-544 (Administrators)

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> User Rights Assignment >> Modify firmware environment values

to include only the following accounts or groups:

- Administrators

References:

1.272 WN22-UR-000190 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 perform volume maintenance tasks user right must only be assigned to the Administrators group.

```
GROUP ID: V-254509
RULE ID: SV-254509r958726
```

Rationale:

Inappropriate granting of user rights can provide system, administrative, and other high-level capabilities.

Accounts with the "Perform volume maintenance tasks" user right can manage volume and disk configurations. This could be used to delete volumes, resulting in data loss or a denial of service.

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>
Security Settings >> Local Policies >> User Rights Assignment
```

If any accounts or groups other than the following are granted the "Perform volume maintenance tasks" user right, this is a finding:

- Administrators

For server core installations, run the following command:

```
Secedit /Export /Areas User_Rights /cfg c:\path\filename.txt
```

Review the text file.

If any SIDs other than the following are granted the "SeManageVolumePrivilege" user right, this is a finding:

- S-1-5-32-544 (Administrators)

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> User Rights Assignment >> Perform volume maintenance tasks

to include only the following accounts or groups:

1.273 WN22-UR-000200 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 profile single process user right must only be assigned to the Administrators group.

```
GROUP ID: V-254510
RULE ID: SV-254510r958726
```

Rationale:

Inappropriate granting of user rights can provide system, administrative, and other high-level capabilities.

Accounts with the "Profile single process" user right can monitor nonsystem processes performance. An attacker could use this to identify processes to attack.

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>
Security Settings >> Local Policies >> User Rights Assignment
```

If any accounts or groups other than the following are granted the "Profile single process" user right, this is a finding:

- Administrators

For server core installations, run the following command:

```
Secedit /Export /Areas User_Rights /cfg c:\path\filename.txt
```

Review the text file.

If any SIDs other than the following are granted the "SeProfileSingleProcessPrivilege" user right, this is a finding:

- S-1-5-32-544 (Administrators)

Remediation:

Configure the policy value for

Computer Configuration >> Windows Settings >> Security Settings >> Local Policies >> User Rights Assignment >> Profile single process

to include only the following accounts or groups:

1.274 WN22-UR-000210 (Automated)

Profile Applicability:

- DC SEVERITY: CAT II
- MS SEVERITY: CAT II

Description:

Windows Server 2022 restore files and directories user right must only be assigned to the Administrators group.

GROUP ID: V-254511 RULE ID: SV-254511r958726

Rationale:

Inappropriate granting of user rights can provide system, administrative, and other high-level capabilities.

Accounts with the "Restore files and directories" user right can circumvent file and directory permissions and could allow access to sensitive data. It could also be used to overwrite more current data.

Audit:

Verify the effective setting in Local Group Policy Editor.

Run "gpedit.msc".

Navigate to

```
Local Computer Policy >> Computer Configuration >> Windows Settings >>  
Security Settings >> Local Policies >> User Rights Assignment
```

If any accounts or groups other than the following are granted the "Restore files and directories" user right, this is a finding:

- Administrators

For server core installations, run the following command:

```
Secedit /Export /Areas User_Rights /cfg c:\path\filename.txt
```

Review the text file.

If any SIDs other than the following are granted the "SeRestorePrivilege" user right, this is a finding:

- S-1-5-32-544 (Administrators)

If an application requires this user right, this would not be a finding.

Vendor documentation must support the requirement for having the user right.

The requirement must be documented with the Information System Security Officer (ISSO).

The application account must meet requirements for application account passwords, such as length (WN22-00-000050) and required frequency of changes (WN22-00-000060).
