A repeatable document workflow

A compact technical guide authored with the Markdown builder.

1. Describe the document

Keep data, document construction, and delivery as separate steps.

```csharp
var report = MarkdownDoc.Create()
.H1("Weekly delivery")
.P("Generated from application data.");
```

2. Check the output

Check	Purpose
Source text	Keep an editable, portable input
PDF preview	Inspect page flow and typography
Output hash	Identify the generated artifact

> **Start small**
>
> Build a representative document before adding a batch pipeline.

3. Share the result

- Keep the original Markdown alongside the PDF.
- Use the same guide in repository documentation and a report bundle.
